Figure 1.15. Overheating Indicators and Capital Inflows

Among G20 economies, a growing number of emerging market economies and a few advanced economies either are close to or are already overheating. Macroeconomic policies in these economies are still accommodative. Capital inflows have also rebounded, exceeding precrisis averages in a number of emerging market economies. With limited recourse to capital controls, these economies have relied widely on prudential measures.

Overheating Indicators—G201

Policy Responses to Capital Flows—Selected Economies⁷

¹ For each indicator, except inflation, economies are assigned "traffic lights" based on where they stand relative to other G20 economies. For inflation, economies with an inflation-targeting regime are assigned a red light if inflation is above the upper bound of their target and a yellow light if inflation is in the upper half of the target range; for nontargeters, a red light denotes historically high inflation, and a yellow light denotes rising inflation (above historically moderate levels). Individual indicators vary for idiosyncratic reasons (e.g., South Africa has a red light for unemployment because the rate is currently lower than precrisis levels, even though unemployment is still above 20 percent). For this reason, a summary column is included, which shows the average across individual indicators; economies are ranked according to this average.

²Output above the precrisis trend is indicated by a red light. Output less than 95 percent of the trend is indicated by a green light.

³An output gap above zero is indicated by a red light. A gap below 2 percent is indicated by a green light.

⁴The unemployment indicator is based on a comparison of current unemployment levels to average precrisis levels during 2002–07.

⁵ Arrows in the fiscal balance column represent the forecast change in the structural balance as a percent of GDP over the period 2010–11. An increase of more than 0.5 percent of GDP is indicated by an up arrow; a decrease of more than 0.5 percent of GDP is indicated by a down arrow.

⁶Real policy interest rates below zero are identified by a down arrow; real interest rates above 3 percent are identified by an up arrow.

For the purposes of this figure, policy responses are divided into three categories: (1) domestically focused macroprudential measures are those affecting the domestic activities of banks, such as loan-to-valuation ratio limits; (2) currency-related measures aim to limit institutions' and residents' exposure to currency fluctuations; and (3) capital controls are measures that distinguish between residents and nonresidents.

8Gross capital flows over the past year compared with the average during 2000–07. Current flows above 150 percent of the average are assigned a red light; a yellow light denotes flows above

¹⁰⁰ percent. Economies are ranked based on this ratio.

⁹Economies with exchange rates higher than warranted by medium-term fundamentals are assigned a red light. Economies with lower-than-warranted exchange rates are assigned a green light. FX = foreign exchange.

10 Has relaxed capital outflow restrictions.
