

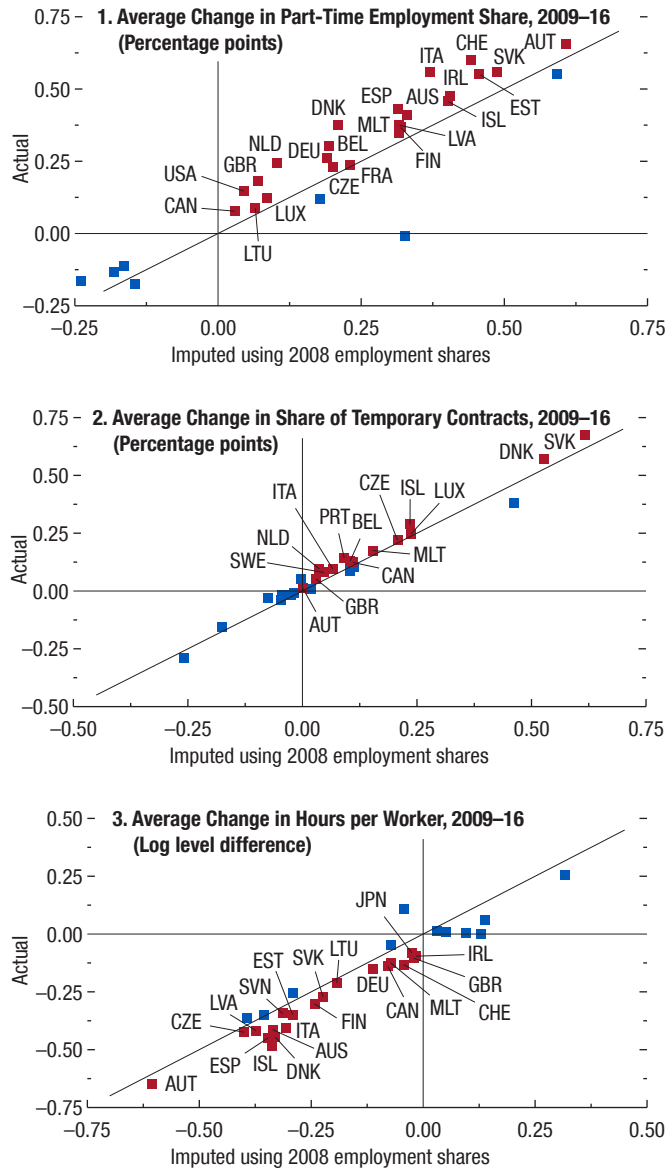

**Figure 2.7. Changes in Labor Market Indicators, Actual versus Imputed Using 2008 Sectoral Employment Shares**

Compositional change played an important role for changes in job attributes. Shifts in employment shares across sectors can explain about 22 percent of the increase in the part-time employment share, 18 percent of the increase in the share of temporary contracts, and 23 percent of the reduction in hours per worker.

Sources: Eurostat; national authorities; and IMF staff calculations.  
 Note: The part-time employment share is calculated as the number of part-time workers in a sector divided by total employment in the sector. Temporary workers are people with work contracts of limited duration; thresholds are country specific. The share of temporary contracts is calculated as the number of temporary workers in a sector divided by total employment in the sector. Countries in red represent cases in which compositional changes amplified within-sector increases (panels 1 and 2) or decreases (panel 3). Data labels in the figure use International Organization for Standardization (ISO) country codes.
