

EBA ESTIMATES: ANALYSIS OF 2017 CURRENT ACCOUNTS AND REAL EFFECTIVE EXCHANGE RATES¹

Introduction

The attached tables contain estimates from the External Balance Assessment (EBA) analysis of 2017 current accounts and real exchange rates, computed in June 2018 by the Research Department. The estimates are based on the methodology refined in 2018. For details of the 2018 refinements, please refer to the technical supplement [Refinements to the External Balance Assessment Methodology—Technical Supplement](#).²

These EBA estimates are used as input in the *2018 External Sector Report* and the *2018 External Sector Report: Individual Economy Assessments*.

The EBA analysis is of the 2017 outturns of the current account (CA) and 2017 year-average real effective exchange rates (REER). The external sustainability (ES) analysis is with reference to projections of 2022 current accounts.

EBA estimates presented in the attached tables are provided for the 26 countries that are analyzed in the 2018 External Sector Report³. In addition, estimates are also shown for the euro area aggregate, which are constructed using weighted averages of the EBA estimates for the 11 largest euro area economies.

Data Vintage

All analyses draw on data that were available to IMF staff as of June 2018:

- [World Economic Outlook \(WEO\)](#) database as of June 2018.
- Demographic data are drawn from [UN World Population Prospects \(2017\)](#).
- The capital control index from [Quinn \(1997\)](#) was updated through 2015.
- Other third-party indicators (e.g. [ICRG](#)) were updated accordingly.

Organization

The attached tables are organized in four sections. As with past External Sector Report, these correspond to four sets of estimates:

Section I:	Regression-based analysis of 2017 Current Accounts
Section II:	Regression-based analysis of the 2017 REER Index
Section III:	Regression-based analysis of the 2017 REER Level
Section IV:	External Sustainability Analysis

¹ Prepared by the IMF Research Department. For queries please email: RESEBA@imf.org.

² See [IMF Working Paper WP/13/272](#) for a complete description of the EBA methodology. A description of the refinements undertaken in 2015 can be found in either [Annex I of the 2015 External Sector Report](#) or the following Technical Background Note [2015 Refinements to the External Balance Assessment \(EBA\) Methodology](#).

³ REER index and level models include 25 countries.

SECTION I—CURRENT ACCOUNT REGRESSION-BASED ANALYSIS

The tables on the following pages contain results from the EBA analysis of 2017 current account balances (CA, as percent of GDP).

The first table decomposes the 2017 CAs into a cyclical component (related to both the business cycle and commodity price cycle) and a cyclically-adjusted component. The latter is further decomposed into a cyclically-adjusted CA “norm” (calculated using desirable P* policy settings), a gap that arises from the estimated contributions of five policy gaps, and a regression residual. The last column is the Total CA Gap, the sum of the overall policy gaps and the residual.

The CA numbers in the first table include small adjustments that have been applied uniformly across countries (in terms of a country’s own GDP) to ensure multilateral consistency. Thus, the cross-country sum of the CA norm levels, when measured in U.S. dollars, matches the sum of the actual 2017 CA levels of all 49 EBA countries.

The second table breaks down the policy gap contributions by the five policies covered in the EBA CA analysis. For each policy gap, the reported estimates include both the total contribution and the subcomponent that is “domestic” (i.e., arising from a country’s own policies).

The five subsequent tables (Table 3-7) show further detail on the derivation of the policy gap contributions. The abbreviation “wo” is used to denote the world average counterparts of the variables (in all cases, world averages are obtained as GDP-weighted averages of the relevant variables).

The final table of this section (Table 8) shows the derivation of the cyclical component of the CA.

Finally, Table 9 shows the estimated coefficients of the EBA CA model.

Table 1. EBA Regression Analysis of 2017 Current Accounts

(In percent of GDP, includes multilateral consistency adjustments)

	Actual CA	Cyclical Contributions (incl. ToT) 1/	Cyclically Adjusted 2016 CA	Cyclically Adjusted CA Norm 2/	Contribution of Identified Policy Gaps	Unexplained Residual	Total Gap, including Residual
Argentina	-4.8%	0.1%	-5.0%	-1.7%	-0.1%	-3.1%	-3.3%

United Kingdom	-4.1%	-0.1%	-4.0%	1.0%	-0.4%	-4.6%	-5.0%
United States	-2.4%	-0.1%	-2.3%	-0.7%	-0.6%	-1.0%	-1.6%
Euro Area 3/	3.5%	0.1%	3.4%	1.5%	0.7%	1.2%	1.9%

1/ Sum of estimated contributions of output cycle and commodity terms of trade cycle.

2/ Current account norm determined by regression evaluated at observed fundamentals and desirable policy settings (and zero cyclical contributions).

3/ Euro area current account gaps and policy gap contributions are calculated as GDP-weighted averages of values for the 11 largest Euro area economies. The CA norm is corrected for reporting discrepancies in intra-area transactions, since the CA of the entire Euro area is about ½ percent of GDP less than the sum of the individual 11 countries' CA balances (for which no such correction is available).

Note: variables denoted with # are constructed relative to a (GDP-weighted) country sample average, in each year.

SECTION II—REER REGRESSION-BASED ANALYSIS: INDEX REER

This section contains results from the EBA analysis of 2017 (year average) REER index values.

The summary table (Table 10) identifies a Total (Index) REER Gap as the sum of two parts: a gap that arises from the estimated contributions of policy gaps, and a gap that is the regression residual.

Here the contributions of policy gaps refer to 5 types of policies, the contributions of which are also shown separately. The contributions of each policy gap are calculated analogously to the procedure used for the CA analysis, as described in the previous section. The REER gap estimates are adjusted for multilateral consistency.

The second table (Table 11) breaks down the policy gap contributions into the 5 types of policies covered by EBA's REER regression-based analysis. As with the CA tables, for each policy gap, the reported estimates show both the total contribution but also the subcomponent that is "domestic". The tables on the subsequent pages (Tables 12-16) give details of each of the estimated policy gap contributions to REER.

Finally, Table 17 shows the estimated coefficients of the Index REER model.

Table 10. EBA Analysis of the 2017 REER

	Total REER Gap ^{/a}	Net Contributions of Policy Gaps						Residual ^{/a}	Memo: May'18 REER, % dev. from 2017 avg. REER (GDS)

SECTION III— REER REGRESSION-BASED ANALYSIS: LEVEL REER

This section contains results from the EBA analysis of 2017 (year average) levels of the REER.

In comparison to Section III, the key difference is that the regression analysis uses as a dependent variable a measure of the level of the country's real exchange rate (rather than a REER index), which contains no information about the relative prices across economies. The independent variables in the Level REER regression are similar, though not identical, to those used in the Index REER analysis.

The structure and presentation of the tables is similar to that of Section II.

Table 18. EBA Analysis of the 2017 Level of the REER

	Total REER Gap ^{/a}	Net Contributions of Policy Gaps						Residual ^{/a}
		Sum	Health Exp.	Capital Control	Reserves	Private Credit	Real Interest Rate	
Australia	17.1%	-0.4%	-0.4%	0.0%	0.1%	-0.2%	0.1%	17.5%

SECTION IV— EXTERNAL SUSTAINABILITY ANALYSIS

The table on the following page present results from the application of the External Sustainability (ES) approach, as originally developed for the CGER methodology.

The ES approach calculates the CA/GDP adjustment consistent with stabilizing NFA/GDP at a benchmark level (second column). For the majority of countries analyzed, the NFA/GDP benchmark is set at the recent (2016) actual level (first column).³ For a select group of economies with extremely high net external liabilities, low net external liabilities, or that are exporters of non-renewable resources, the benchmark is modified on the basis of regional averages or other criteria.

The ES method first calculates the CA/GDP level that would stabilize the NFA/GDP at the benchmark level. The second step compares the WEO-projected 2022 CA/GDP (assuming real exchange rates that are constant at their 2017 levels, current policies and adjusted for closed output gaps) with the NFA benchmark stabilizing CA/GDP.

The second last column presents the CA gap according to the ES method; that is, the difference between the adjusted CA projected for 2022 and the CA that would stabilize the NFA/GDP ratio at the benchmark level.

³ We rely on 2016 NFA/GDP due to data availability. NFA is calculated following the methodology of [Lane and Milesi-Ferretti \(2007\)](#).

Table 26. External Sustainability Approach: NFA-stabilizing Current Accounts 1/

	2016 NFA/GDP	Benchmark NFA/GDP	Unadjusted medium-term CA/GDP 2/	Adjusted medium-term CA/GDP	CA/GDP Stabilizing NFA at Benchmark	CA/GDP Gap	Assumed CA/REER Elasticity 3/	Corresponding REER Gap

1/ Based on the CGER "ES" methodology ; CA includes capital account in addition to current account.

2/ Based on WEO database as of June 21st, 2018

3/ In most cases, figures shown are based on a common elasticity assumption of -0.71 for exports and 0.92 for imports, which were estimated from a previous CGER model. These estimated elasticities can differ from staff-assessed elasticities due to additional country-specific considerations.
