I. RECENT ECONOMIC DEVELOPMENTS¹

A. Introduction

1. **The Netherlands Antilles has a high standard of living in regional comparison** (Figure 1). As is typical for small island economies, the Antillean economy lacks natural resources and is very open and undiversified, relying mainly on exports of services such as tourism, international financial services, shipping, and oil refining. The islands benefited from their geographical position and their constitutional arrangement—a close link with the Netherlands—to achieve this level of well-being. The establishment of the oil refinery and of the international financial center can be attributed to Curaçao's geographical location and political and legal stability in the Netherlands Antilles. These two industries have provided the islands with a substantial source of income.

2. **In 1985, however, both activities shrunk, leading to persistent fiscal imbalances and high unemployment.** Following the repeal of the tax treaty with the United States in 1985,² the international financial sector has been in structural decline, and both tax and foreign exchange revenues from this sector have declined. Royal Dutch Shell closed its operations on Curaçao in 1985 and sold the refinery for a symbolic amount to the island government. The refinery was the main provider of jobs on the island, and to avoid a major increase in unemployment, the government signed a lease contract with the Venezuelan-owned oil company, PDVSA. Public finances have not adjusted completely to the structural decline in revenues stemming from the closure of the Shell refinery and the reduced importance of international financial services. In the 1990s, the central and island governments made two attempts at fiscal consolidation under programs designed with the assistance of Fund staff. Both attempts went off track due to lack of political commitment and financing constraints.

3. This paper provides a brief review of the economic developments and policies over the period 2000–05.

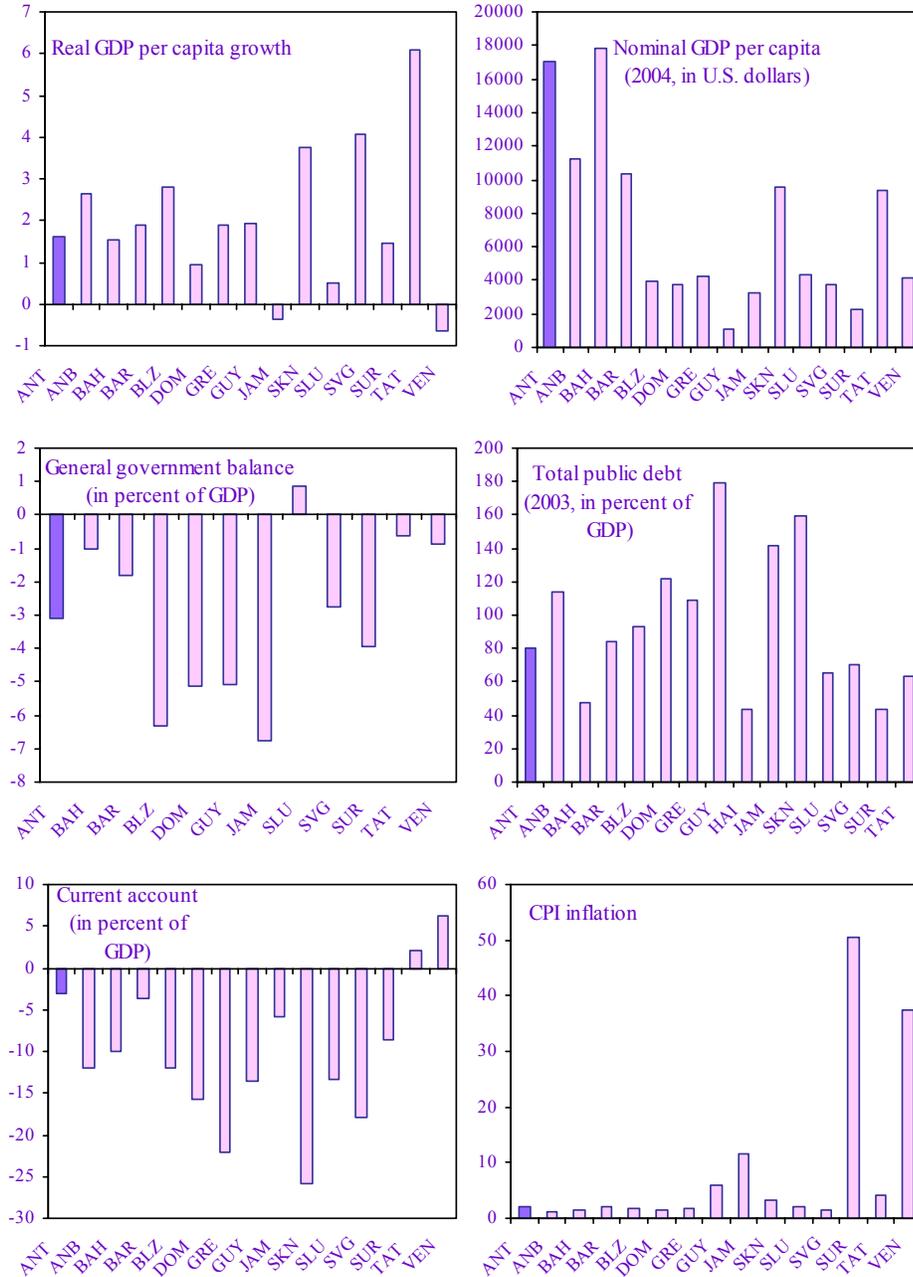

B. Production, Prices, and Labor Market Development

4. **After a prolonged recession, the economy recovered, albeit slowly and with relative volatility.** Between 2000–05, GDP growth was supported particularly by buoyant tourism activity, as reflected by increased added value in the hotel and restaurant sector and the retail trade sector (Statistical Appendix Table 1). The low rate of inflation also contributed to

¹ Prepared by Wendly Daal.

² The United States applied a withholding tax on interest payments to nonresidents, which prior to 1984, however, did not apply to the Netherlands Antilles, as they were signatory to a double tax treaty.

Figure 1. Netherlands Antilles: Regional Perspective
(Average, 1995-2004)

Source: IMF, WEO.

Country Code: Netherlands Antilles=ANT, Antigua & Barbuda=ANB, Bahamas=BAH, Barbados=BAR, Belize=BLZ, Dominica=DOM, Grenada=GRE, Guyana=GUY, Haiti=HAI, Jamaica=JAM, St. Kitts and Nevis=SKN, St. Lucia=SLU, St. Vincent and the Grenadines=SVG, Suriname=SUR, Trinidad & Tobago=TAT, Venezuela=VEN.

a favorable economic environment. Amid the slow economic recovery, unemployment remained high due to labor market rigidities. At the same time, there was an increasing net inflow of workers. Prospects for sustained higher growth in the medium term look favorable in the light of the investment projects in the tourism sector.

5. An improved world economy was conducive to the recent economic growth.

Exports and domestic consumer spending—both private and public—drove the economic recovery. Economic growth in the United States and the appreciation of the euro against the national currency contributed to the strong performance in the tourism sector. However, regional instability and the closure of the national airline had a negative impact on the manufacturing (oil refinery) and the transportation sectors. Increased demand—given the lack of natural resources, the openness, and size of the economy—led to a substantial expansion in goods and services imports. Investment remained lackluster amidst increasing uncertainty linked to deteriorating public finances and unresolved issues surrounding the breakup of the federation of the Netherlands Antilles.

6. Despite the hike in oil prices, the underlying rate of inflation in the Netherlands Antilles has remained low (Figure 2).

The fixed exchange rate against the U.S. dollar helped anchor inflation expectation. In addition, the government has absorbed a large part of the oil price increase. At the end of 2005, the island government of Curaçao established an energy fund to absorb further increases in the oil price. This fund was financed by the island government and the oil distribution company, CUROIL. The gradual phasing-out of economic levies in compliance with the WTO also kept the rate of consumer price inflation low.

7. Job creation has remained weak against the increased net influx of migrants.

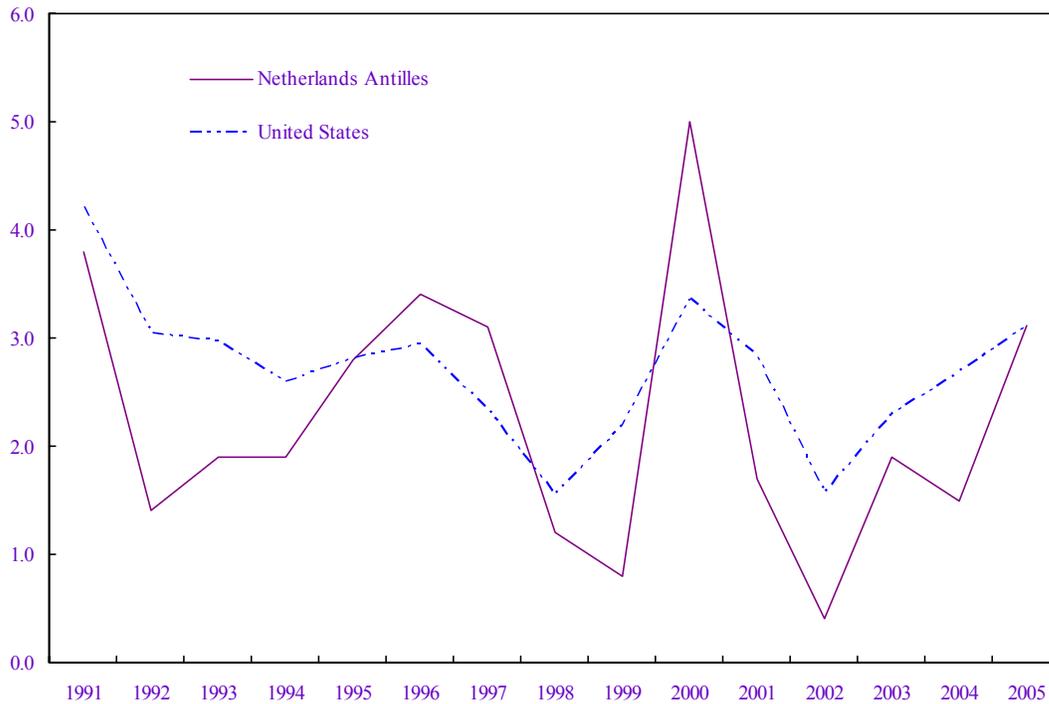

The rate of unemployment has been fluctuating around 15 percent, and preliminary data indicate that it increased to 16.3 percent in 2005 (Statistical Appendix Table 2). In line with the economic recovery, job creation went up during this period, but not enough to accommodate for population growth. The latter has been largely the result of the turnaround in net migration. Employers' organizations view persistent labor market rigidities as having hindered job creation. The average wage per worker has decreased in real terms, which may be the result of the increased influx of low-skilled immigrant workers from the region. There is no data on total amount of hours worked, but productivity measured by production per worker has been fluctuating without a clear trend.

8. Economic prospects look favorable in the medium term.

The prospects are largely determined by ongoing infrastructure investments—the upgrading of the airports on Curaçao and St. Maarten—and large-scale investment projects in the tourism sector on both islands. The arrival of American chain hotels will expand the hotel capacity and also attract more American visitors. Some American airlines starting regular flight connections with the United States will also bring more tourists from this market to the island of Curaçao. A new

tax treaty with the Netherlands is expected to contain the decline in the international financial sector.³

Figure 2. Netherlands Antilles: Consumer Price Inflation, 1991-2005 1/

Sources: Data provided by the authorities; and IMF, WEO.

1/ Projections in 2005.

C. Public Finance

9. **Expenditures on goods and services increased, partly driven by health care costs** (Statistical Appendix Tables 3–5). In addition, substantial interest payments have risen as a result of the formalization of arrears and of back payments of interest due on Dutch development loans. Personnel spending increased as the payment of pension premiums to the civil servant pension fund was regularized, the wage freeze ended, and additional staff was hired.

³ The Netherlands Antilles and the Netherlands signed a tax treaty in 2000, Tax Arrangement for the Kingdom, governing dividend flows between the two countries. This treaty stipulates that a tax of 8.3 percent is applicable on dividend flows between the two countries. The Netherlands Antillean authorities collect 3.3 percent, while the Dutch authorities collect 5 percent and transfer the proceeds to the Netherlands Antilles. The new treaty that becomes effective in 2006 applies a tax rate varying from 0 percent to 5 percent depending on the type of company and how the dividends are invested. It is expected that this new treaty will enable the Netherlands Antilles to compete with other financial centers on an equal footing.

10. Government revenues in percent of GDP have remained practically unchanged.

In line with the economic recovery, taxes on goods and services recovered strongly after a reorganization of the tax administration led to a decline in tax collection in 2001. Direct tax revenues as percent of GDP have been growing. In 2001 and 2002, there were exceptional increases in direct tax revenues due to considerable efforts to clear backlogs and technical assistance from the Netherlands for the tax auditing office. In contrast, taxes on international transactions have been declining as percentage of GDP due to the gradual phasing-out of economic levies. Two large transfers of dividend tax from the international financial sector by the Dutch government contributed substantially to government revenues growth, in particular in 2005. These large swings in dividend tax transfers result from international financial companies liquidating their assets in the Netherlands Antilles and transferring these to the Netherlands.

11. The authorities revised the tax system with the intention of boosting households' disposable income and economic growth.

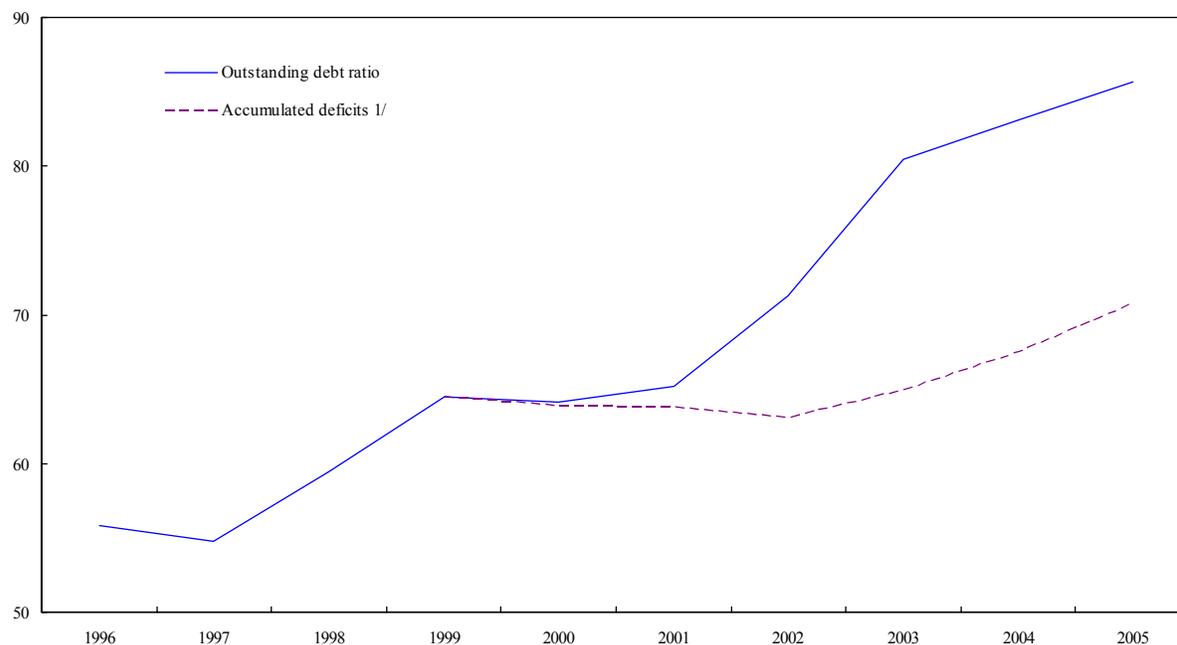

At the beginning of 2005, the authorities reduced the marginal tax rate by 6.4 percent, the first phase of a 12.4 percent reduction in income tax rate. The next phase of the tax reduction will be implemented in 2006. The impact of the 2005 tax reduction will be felt in 2006, when the income taxes for 2005 become due. The authorities estimate the impact of this reduction to be about 1 percent of GDP.

12. Financing of the large deficits was not a major problem thanks to the excessive liquidity in domestic financial market.

Unfavorable conditions in the international financial markets, in particular the low U.S. interest rates and the bursting of the equity bubble in the United States, led to a large repatriation of maturing investment abroad by local institutional investors. Given the excess liquidity in the domestic market, the governments could borrow at a relatively low rate. The outstanding stock of public debt increased to 85.7 percent of GDP in 2005, up from 64.2 percent in 2000 (Statistical Appendix Tables 3–7). Large part of this accumulation of debt—approximately 15 percent of GDP—is accounted for by arrears with, among others, the pension fund (APNA) and the public health insurance company (SVB) into long-term marketable bonds (Figure 3).⁴ The deficit financing accounted for the remaining 7 percent of GDP.

⁴ The accumulation of arrears to APNA and SVB took place over a prolonged period of time, with debt conversions taking place in 2001 and 2002.

Figure 3. Netherlands Antilles: Total Public Debt, 1996-2005
(End of period; in percent of GDP)

1/ Starting from the debt position in 1999, the consecutive budgetary deficits are accumulated. The differences between the two lines are the stock adjustments.

D. Balance of Payments

13. **The trade deficit widened in line with the economic recovery** (Statistical Appendix Table 8). Merchandise imports have grown strongly in this period, fueled by increased domestic and tourist demand, particularly in the Windward Islands. Higher oil prices have also contributed. Imports of merchandise by companies operating in the free-zone—partly for stock-building and partly to meet domestic demand—also added to the worsening of the trade balance.⁵

14. **Increased service activities, stemming particularly from tourism, partially compensated for the widening merchandise deficit.** The tourism sector recovered strongly after several hurricanes that hit the Windward Islands and the terrorist attack on the United States on September 11, 2001. The islands increased their market share in the U.S. tourism market. An improved competitive position in the European market due to the appreciation of the euro further boosted tourism growth. Large Dutch transfers of dividend taxes from the international financial sector and private transfers from households abroad also contained the current account deficit.

⁵ Reexporting companies operating in the free zone are allowed to sell up to 20 percent of their turnover on the local market.

15. **Current account deficits were in recent years largely financed by foreign borrowing, rather than by reserve depletion.** Data on the outstanding stock of private sector foreign debt are not available, but the BNA estimates that the outstanding stock of total foreign debt has increased to 36.3 percent of GDP in 2005 (Statistical Appendix Table 9). This growth is largely accounted for by the amount of net trade credit received to finance the growing need for merchandise imports. In addition, the construction of the airports of St. Maarten and Curaçao and investment projects in the utilities sector were largely financed by foreign loans. Direct investments have risen, due to the takeover of the Girobank by a foreign bank, the injection of capital by a direct investor in its financial institution, and the purchase of real estate by nonresidents.

16. **The stock of official net international reserves rose from 1.9 to 2.9 months of import coverage.** The buildup of reserves between 2000 and 2005 was due to large amounts of development aid (Statistical Appendix Table 10), private capital inflows, and foreign borrowing. Unfavorable developments in international financial markets led to a repatriation of maturing investment funds abroad by residents in 2002–03. Portfolio investment abroad increased again in 2004, as interest rates on the international financial markets started to rise.

E. Money, Banking, and Nonbank Financial Sector

17. **Money and credit growth outpaced nominal GDP during the 2000–05 period** (Statistical Appendix Table 11). Strong growth in money supply stemmed from the net accumulation of foreign assets and net domestic credit—with credit expansion contributing substantially to money growth (66.1 percent). A considerable part of credit growth was due to increased demand for mortgage loans by the private sector and general government borrowing. Net foreign assets rose strongly in light of the repatriation of maturing foreign investment by local institutional investors, large transfers of dividend taxes from the international financial sector by the Dutch government, and large amounts of Dutch development aid transferred to USONA.⁶

18. **Strong demand for time deposits contributed to the growth of monetary aggregates.** Large local institutional investors—pension funds and insurance companies—have been the main investors in time deposits at banks. Local institutional investors temporarily shifted their investment portfolio from foreign securities to local securities, as a result of the noted unfavorable conditions on the international financial markets. Due to the lack of competitive investment alternative to government securities on the domestic market, domestic investors resorted to time deposits.

19. **The performance of the domestic banking sector improved during 2000–04 despite weak growth.** The profitability of commercial banks improved, and total assets

⁶ *Uitvoeringsorganisatie Stichting Ontwikkeling Nederlandse Antillen* (USONA), the organization responsible for implementing development aid projects.

strengthened. As a result, all but one bank met the central bank's solvency requirement—namely, total capital over total adjusted assets⁷—of 10.5 percent (Statistical Appendix Table 12). Commercial banks increased their outstanding loans, investments, and interest-bearing cash holdings (in particular certificates of deposit). The sector also increased its capitalization by the end of 2004, owing to the recapitalization of the Girobank. The asset quality of the banking sector improved, as the ratio of nonperforming loans declined to 3.6 percent at the end of 2004, and the provision for loan losses was strengthened further to 97 percent. The concentration in the banking sector increased in the last two years, with three banks holding 75 percent of total assets. The international banking sector remained sound, as total assets increased in 2004 after a drop in 2003, despite the loss in market share to less-regulated or better-located competitors (Statistical Appendix Table 13). However, profits in this sector remained under pressure due to increased provisions and extraordinary losses. A new agreement was reached with the Netherlands regarding taxation of dividends earned by Dutch citizens on their investment in companies operating in the international financial sector in the Netherlands Antilles. It is expected that this new treaty will provide stability in the sector and contain the decline of the last years.

20. Developments on the international financial markets affected the investment strategies of the nonbank financial institutions. Nonbank financial institutions repatriated large part of their maturing investment abroad due to the burst of the equity bubble in the United States and the low interest rates in the United States and Europe. Reports of the BNA indicate that performance in the sector as a whole was positive but that the performance across institutions was mixed. The reports also indicate that performance in the sector was to some extent also affected by lower contributions receipts due to migration and/or early retirement. In addition, higher life expectancy has led to longer-term benefit payments, resulting in increased expenses for the industry. The insurance sector servicing the local market experienced positive results in 2003 (Statistical Appendix Table 14). The solvency requirements have been met on an aggregate basis for the life and nonlife insurance companies operating locally as well as internationally.

⁷ Adjusted total assets is defined as total assets minus the asset categories that are subjected to a zero risk-weighted factor.

II. A TALE OF TWO GROUPS OF CARIBBEAN ECONOMIES⁸

21. As the federation of the Netherlands Antilles dissolves, crucial policy decisions on a broad range of matters that will have a lasting impact on the future of the countries to be born need to be undertaken. Those decisions are contingent, among other factors, on expected trend growth rates. It is well known that determining past trend growth rates is plagued with difficulties; even more so is projecting them into the future. However, a look at the economic performance of a set of Caribbean-region economies may shed some light into that general question and, in particular, into what is the importance of small island economies' links to high income countries.

22. To answer those questions, this study uses a simple and partial statistical exercise applied to a reduced set of economic and social indicators of two groups of Caribbean economies. Group 1 comprises countries that, while having kept some links to the mother country in one way or another, have been independent for some time. Group 2 comprises territories that are part of a kingdom or a commonwealth and are not formal members of the IMF.⁹ The main conclusion is that a few key indicators are better in Group 2 than in Group 1.

23. First, some statistics on the selected economic and social indicators are presented in Table 1.¹⁰ Average GDP per capita and life expectancy are significantly larger in Group 2 than in Group 1 at the 95 percent confidence level. Inflation is significantly lower in Group 2 than in Group 1 at the 90 percent confidence level.

24. Second, simple regression analysis largely confirms the descriptive statistics outcome. Table 2 displays the results of five cross-section regressions on a constant and each of the selected economic and social indicators.¹¹ The dependent variable is a dummy that takes the value of zero if the macroeconomic data refer to Group 1 and the value of one if the data refer to Group 2. GDP per capita and life expectancy have statistically significant coefficients (Figure 1); inflation seems to have some statistical significance. The results suggest that GDP per capita and life expectancy are relatively higher for economies that belong to Group 2 than for economies that belong to Group 1. Some evidence of relatively lower inflation is also associated with Group 2 economies.

⁸ Prepared by Francisco Nadal de Simone.

⁹ Group 1 comprises the following countries: Antigua and Barbuda, The Bahamas, Barbados, Belize, Dominica, Dominican Republic, Grenada, Guyana, Haiti, Jamaica, St. Kitts and Nevis, St. Lucia, St. Vincent and the Grenadines, Suriname, and Trinidad and Tobago. Group 2 comprises the following territories: Anguilla, Aruba, British Virgin Islands, Cayman Islands, Guadeloupe, Martinique, Montserrat, Puerto Rico, St. Pierre and Miquelon, the Turks and Caicos Islands, U.S. Virgin Islands, and the Netherlands Antilles.

¹⁰ Data limitations are severe, especially for territories.

¹¹ The White tests do not reject the null hypothesis of homoskedasticity.

Table 1. Netherlands Antilles: Economic and Social Statistics 1/

	Average		Standard Deviation	
	Group 1	Group 2	Group 1	Group 2
GDP per capita 2/	5519.8 (7,860 - 3,179)	15760.4 (22,093 - 9,428)	4625.1	11192.2

Figure 1. Netherlands Antilles: Selected Indicators by Country Group

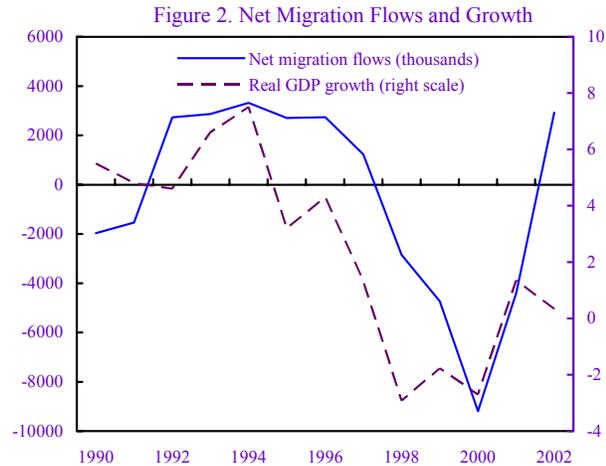

Sources: World Bank, World Development Indicators; CIA, World Factbook; and IMF, WEO.

Country Code: Netherlands Antilles=ANT, Antigua and Barbuda=ANB, Bahamas=BAH, Barbados=BAR, Belize=BLZ, Dominica=DOM, Grenada=GRE, Guyana=GUY, Haiti=HAI, Jamaica=JAM, St. Kitts and Nevis=SKN, St. Lucia=SLU, St. Vincent and the Grenadines=SVG, Suriname=SUR, Trinidad and Tobago=TAT, Venezuela=VEN.

25. Data limitations preclude a thorough analysis of the reasons for these results, and thus the following conclusions should be interpreted as tentative. However, speculation based on

related studies is possible and, hopefully, informative. Many observers have pointed out that free labor mobility between the Antilles and the Netherlands is largely responsible for having set a floor to real wages, which albeit seemingly less binding in recent times, has made adjustment to shocks more costly in terms of output and employment. Yet, it is also possible to argue that the observed high correlation between net migration flows and real GDP growth may be just the most visible part of a mechanism by which the well-known relatively higher volatility of Antillean cycles has had a lesser impact on its trend growth (Figure 2).

Interestingly, Group 1 countries have also been exposed to significant labor force flows. For instance, Mishra (2005) found that Group 1 countries lost 10–40 percent of their labor force—especially the high-skilled part of it—due to migration to OECD countries between 1965 and 2000. In addition, despite that Group 1 is the world’s largest recipient of remittances as a share of GDP, Mishra’s welfare calculations suggested that migration losses tend to outweigh remittances.

26. Cashin (2004) found that the Caribbean cycles (of a subset of Group 1 countries) are more symmetric than those of major industrial countries.¹² Output asymmetries—output grows most of the time close to its natural rate determined by the resources available and the institutions that organize them, and it is plucked downward occasionally—may have been smoothed out through labor force migration flows. Given that job destruction is more cyclically responsive than job creation, migration flows between the Antilles and (largely) the Netherlands may have dampened output growth and income fluctuations.

27. On the positive side, it is likely that the relatively closer links that Group 2 economies entertain with the metropolises have resulted in lower financing costs for firms and thus have propped up investment and trend growth. In contrast, it is also possible that the closer links to the metropolises, by making the financing of fiscal deficits relatively less costly, have resulted in less fiscal discipline. While there are no data on a comparable basis to study this matter in-depth, there is evidence that by 2003, 14 out of 15 Caribbean countries included in Group 1 had an average fiscal deficit of nearly 6 percent of GDP, and they ranked in the top 30 of the world’s highly indebted emerging market countries (Sahay, 2005). Therefore, the positive aspects of the close links to the metropolises may have seemingly prevailed, at least in

¹² See Nadal De Simone and Clarke (2006, forthcoming) for evidence of asymmetric output fluctuations in a set of industrial and emerging economies.

the Antillean case. Looking forward, the evidence cited above indicates that the new countries to be born from the dissolution of the federation should assign priority to a fiscal framework that internalizes fiscal discipline and accountability.

28. This analysis, while partial and limited, suggests that the new countries would also benefit from maximizing the links that their population may maintain with the Netherlands and other countries of migration destination, even if temporary. Those links manifest themselves in several ways, for instance through remittances (mostly official in the Antillean case). There is empirical evidence that remittances can lead to more human and physical investment and thus higher trend growth.¹³

29. What can the new countries do to limit the attraction represented by relatively higher foreign wages? This quick *tour d'horizon* suggests that the best strategy consists on applying policies that set growth-enabling domestic incentives. These policies encompass growth-enhancing structural reforms and reducing the economies' vulnerabilities to shocks. Growth-enhancing policies require increasing the flexibility of labor, to reduce the cost of doing business, to enhance competition in domestic goods and services markets, and to achieve greater regional and multilateral cooperation via freer international trade. In addition, better education, training, and well-targeted infrastructure investment are essential to improve the new countries' attractiveness for foreign investment. Education needs to be better tailored to the needs of these economies, which are largely dependent on services (e.g., tourism and financial services). Given the importance of the financial sector for at least one of the new countries and the well-documented link between weak financial sector supervision and crises, the further strengthening of financial supervision should also be an important policy objective. Finally, while little can be done to reduce the economies' exposure to foreign shocks, the domestic policies already outlined should contribute to reduce shocks' welfare costs by allowing faster relative price changes and setting the ground for world-market driven diversification.

¹³ Cashin (2004) found close links between Eastern Caribbean (EC) business cycles and Canadian cycles, but not between EC cycles and U.S., U.K., or German cycles. The possible reasons include: first, Canada is a major provider of bilateral overseas development assistance flows to those countries. Second, Canada has been an important emigrant destination for Caribbean nationals and thus accounts for a large share of all remittance flows to the area.

Net foreign lending including provisions /Tier 1 capital	4.5	3.8	4.1	4.5	3.9
Average lending spread (lending-deposit rate) 4/	9.6	10.1	10.2	11.2	10.6

Source: Bank van de Nederlandse Antillen.

1/ Extended by commercial banks only.

2/ Corporate sector: business loans + other mortgages. Households: consumer loans + individual mortgages.

3/ Adjusted-total-assets is defined as total assets minus the asset categories that are subject to a zero risk-weighted factor.

4/ Interest rate on working capital loans - time deposit rate. Interest rates for prime borrowers are usually about two percentage points less, but no consistent time series is available. From 12/1999, lending rate is current account overdrafts.
