Ahead of His Time

Mathematician and computer science pioneer Alan Turing will appear on UK currency

Melinda Weir

ONE MONDAY LAST July, Bank of England Governor Mark Carney strode onto the stage at the Science and Industry Museum in Manchester to reveal the next face of the United Kingdom’s £50 note, one that the bank had earmarked for science.

The honor, he announced, would go to Alan Turing (1912–54)—mathematician, World War II code breaker, and father of computer science.

Turing was a visionary as well as a revolutionary, in Carney’s words, and an outstanding mathematician whose work has had a considerable impact on how we live today.

Turing’s seminal 1936 paper “On Computable Numbers” imagined the very concept of modern computing. His code-breaking machine is credited with shortening World War II. And his revolutionary postwar work helped create the world’s first commercial computers and articulated philosophical and logical foundations for artificial intelligence.

He was, Carney said, “a giant on whose shoulders so many now stand.”

Imagining the computer

Celebrated in books and cinema—the 2014 movie The Imitation Game was based on his biography—Turing is best known by the British public for his wartime efforts, Sarah John, the Bank of England’s chief cashier, told F&D. With his colleagues at Bletchley Park, the government’s top-secret codebreaking center, Turing developed the code-breaking Bombe machine and made other advances in decryption, which, building on work from Polish mathematicians, led to cracking the German Enigma code. His team’s work is widely credited with expediting the war’s end, saving millions of lives.

But it is Turing’s influence as a profound and inventive thinker of the modern digital age that the new £50 is celebrating, according to John.

“If you think about where that idea has taken us between 1936 and today,” said John, referring to Turing’s groundbreaking paper that year, which proposed a computing machine, “and how much computers influence our daily lives—we use them at work, at home, in hospitals, most of us have got a small computer in our pockets that we use on a day-to-day basis—that legacy of starting the computer revolution is really what we’re trying to celebrate on this banknote.”

Turing was selected for the £50 after a months-long “Think Science” campaign by the Bank of England, which elicited nearly a quarter-million nominations from the public, later whittled down by a committee of scientists and central bank officials.

The short list included chemist Rosalind Franklin, instrumental in discovering the structure of DNA; theoretical physicist Stephen Hawking; and Srinivasa Ramanujan, who transformed modern mathematics.

Posthumous apology

Turing also left another legacy. Turing was a gay man during a time when Victorian-era antigay laws were in place. He was arrested and convicted
The back of the new £50 note will feature photos of Turing and an early computer developed using his designs, along with technical drawings and mathematical formulas from his 1936 paper, credited with laying the foundations for computer science.

“Turing’s work has resonated with people in the sense they understand how important computers are to our everyday lives,” John said. But his life story has also resonated and “helped demonstrate that some of the prejudices of the past were really quite unjust and that we’ve come a very long way, but also highlighted how far we still have to go in society,” she added.

A photo of Turing, along with a composite image representing some of his groundbreaking ideas and inventions, will appear on the reverse side of the new £50 notes, scheduled to be issued in late 2021.
