Outlook for U.S. shale oil and gas

International Monetary Fund
March 27, 2014 | Washington, DC

By
Adam Sieminski, EIA Administrator
The U.S. has experienced a rapid increase in natural gas and oil production from shale and other tight resources

U.S. tight oil production
million barrels of oil per day

U.S. dry shale gas production
billion cubic feet per day

Sources: EIA derived from state administrative data collected by DrillingInfo Inc. Data are through February 2014 and represent EIA's official tight oil & shale gas estimates, but are not survey data. State abbreviations indicate primary state(s).
U.S. crude oil and natural gas production is up dramatically since 2010 and will continue to grow rapidly; this has strategic implications for the United States.

- Refinery operations/investment
- Logistics infrastructure investment
- Exports of petroleum products
- Exports of crude oil and natural gas (LNG)
- Operation of the Strategic Petroleum Reserve
U.S. shale gas leads growth in total gas production through 2040 to reach half of U.S. output

U.S. dry natural gas production

trillion cubic feet

U.S. natural gas use in the transportation sector grows rapidly with the largest share in freight trucks.

Natural gas use by mode (trillion Btu)

- Freight trucks
- Freight rail and marine
- Buses
- Light-duty vehicles

Approximate crude oil equivalent (thousand barrels per day) 2040
- Freight trucks: 290
- Freight rail and marine: 71
- Buses: 38
- Light-duty vehicles: 9

U.S. transportation sector motor gasoline demand declines, while diesel fuel accounts for a growing portion of the market.

Transportation energy consumption by fuel (quadrillion Btu)

**History**
- 1990: 59%
- 2012: 47%
- 2040: 44%

**Projections**
- 2030: 5%
- 2035: 31%
- 2040: 3%

**Fuel Types**
- Motor gasoline
- Ethanol
- Diesel
- Jet fuel
- CNG/LNG
- Other*

*Includes aviation gasoline, propane, residual fuel oil, lubricants, electricity, and liquid hydrogen

U.S. maintains status as a net exporter of petroleum products

U.S. petroleum product imports and exports
million barrels per day

Source: EIA, Annual Energy Outlook 2014 Early Release
Although oil use is slightly increased in the High Resource case due to lower prices, net import dependence declines rapidly.

U.S. liquid fuel supply
million barrels per day

Source: EIA, Annual Energy Outlook 2014 Reference case and High Resource / Improved Technology case
China is now the world’s largest net oil importer

Net imports for China and the United States
Millions of barrels per day

Note: Net oil imports are defined as total liquid fuels consumption less domestic production
Source: EIA, Short-Term Energy Outlook, March 2014
OPEC countries now account for most unplanned outages

estimated unplanned crude oil production outages
thousand barrels per day

Key findings of the EIA’s International Energy Outlook 2013

• With world GDP rising by 3.6 percent per year, world energy use will grow by 56 percent between 2010 and 2040; half of the increase is attributed to China and India

• Renewable energy and nuclear power are the world’s fastest-growing energy sources, each increasing by 2.5 percent per year; however, fossil fuels continue to supply almost 80 percent of world energy use through 2040

• Natural gas is the fastest growing fossil fuel in the outlook, supported by increasing supplies of shale gas, particularly in the United States

• Coal grows faster than petroleum consumption until after 2030, mostly due to increases in China’s consumption of coal, and slow growth in oil demand in OECD member countries

• Given current policies and regulations, worldwide energy-related carbon dioxide emissions are projected to increase 46 percent by 2040, reaching 45 billion metric tons in 2040
Economic activity and population drive increases in energy use; energy intensity improvements moderate this trend
