Ujjayant Chakravorty, Carolyn Fischer , Marie-Helene Hubert

#### Nuclear Power 101

- Current Installed Capacity = 380 GWe
- Total Power Generated from Nuclear in 2014 = 2410 TWh
- Output per GWe of Capacity = 6.34 TWh (Max: 8.76 TWh)
- IEA Projections = 767 GWe by 2040
- Average Annual Growth of Nuclear Capacity = 14.9 GWe

### Can Nuclear Power Meet Chinese Paris Commitments?

- Annual growth of power supply from nuclear at
  95.3 TWh
- Allocated according to share of plant construction by region
- China: 50%, ROW: 35%, North America: 15%
- Annual Growth in Nuclear Power of 47.6 TWh
- 2014 nuclear output: 124 TWh (or 2% of electricity generated)
- IAEA Projections for Nuclear: 1,065 TWh in

2030 (or 20% of electricity generated) Ujjavant Chakravorty, Carolyn Fischer, Marie-Helene Hubert A Simple Three Agent Model to Study Chinese Clean Energy Policy

- We build a dynamic, partial equilibrium model
- The model has 3 regions and no strategic behavior
  - China
  - North America (US, Canada and Mexico)
  - Rest Of the World (ROW)

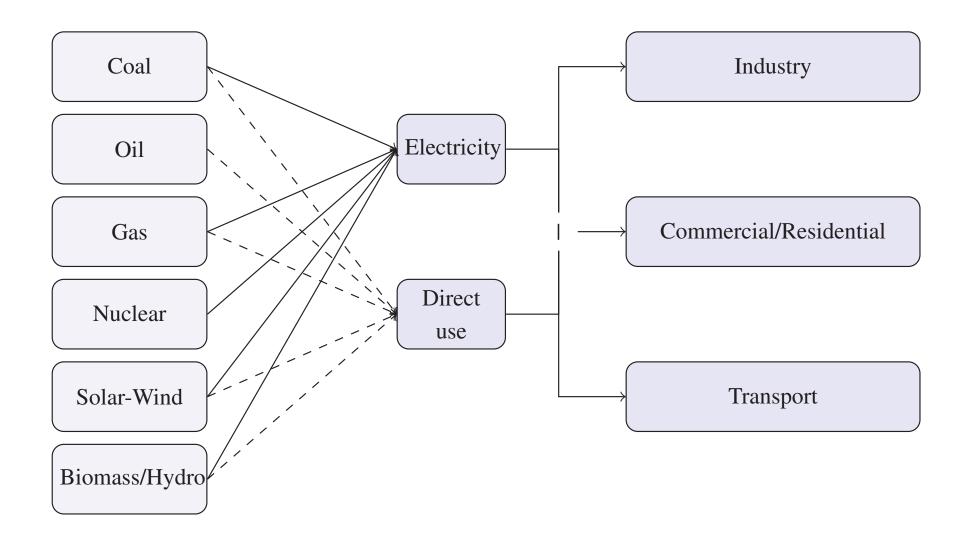

#### Questions to Answer

- CAN CHINA REDUCE COAL USE BY EXPANDING NUCLEAR?
- WILL NUCLEAR POWER CROWD OUT RENEWABLES?
- WILL A CARBON TAX BE NECESSARY AND HOW BIG?
- HOW DO LEARNING RATES AFFECT SUBSTITUTION OF COAL BY RENEWABLES?

#### **Energy Sectors**

- Energy resources:
- Coal, oil, natural gas
- Solar and wind
- Nuclear power
- Other renewables: biomass and hydro
- Energy-consuming sectors:
- Transport, industrial, residential/commercial

#### Schematic of the Model

## Energy Supply Curves

- Fossil fuels have upward-sloping curves in each region calibrated from IEA data Graph
- They are tradable
- Transportation costs equal baseline price differentials

#### Extraction Cost of Fossil Fuels in Base Year (2013)

|                   | North America | China | ROW |
|-------------------|---------------|-------|-----|
| Coal (US\$/ton)   | 87            | 105   | 96  |
| Oil (US\$/barrel) | 50            | 52    | 30  |
| Gas (\$/MMBTu)    | 2.50          | 3.50  | 3   |

IEA (2014) and BP Statistics (2013)

Ujjayant Chakravorty, Carolyn Fischer, Marie-Helene Hubert POST-PARIS CLEAN ENERGY OPTIONS: THE CASE OF CHIN

#### Cost of Supplying Electricity: Coal and Gas

| Cost in US\$/MWh |      |     |  |
|------------------|------|-----|--|
|                  | Coal | Gas |  |
| North America    | 68   | 76  |  |
| China            | 29   | 35  |  |
| ROW              | 32   | 54  |  |

5% discount rate; IEA (2012)

Costs include investment and O&M

#### Cost of Supplying Electricity: Nuclear

|               | Cost in US\$/MWh |  |  |
|---------------|------------------|--|--|
| North America | 48               |  |  |
| China         | 33               |  |  |
| ROW           | 50               |  |  |

5% discount rate; IEA (2012)

Cost of Electricity from Solar/Wind: 90/MWh

#### Model Assumptions

- We divide renewables into wind/solar and hydro/biomass
- We fix nuclear either at IEA estimates or a complete freeze
- We fix generation from hydro/biomass because that is unlikely to grow significantly
- Learning by doing is modeled by cost reductions as a function of cumulative production

#### Modeling Learning by Doing

• The average cost of investment in electricity  $C_T$ , from solar and wind at date T is given by:

$$C_T = \alpha [\sum_{t=1}^T q_t]^{-b} \tag{1}$$

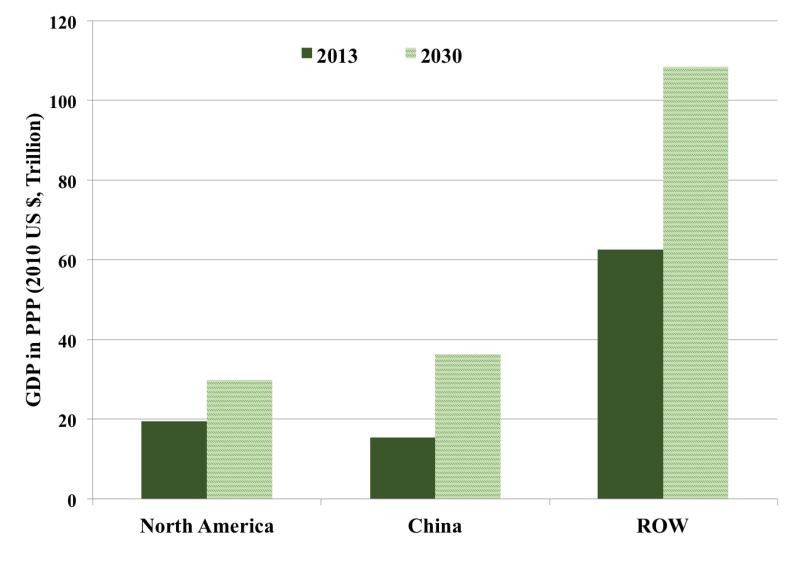

- b: learning rate parameter,  $\alpha$ : calibrated constant
- For a learning rate equal to 15%, the average cost decreases by  $1 2^{0.15} = 11\%$  with doubling of production.
- Operation and maintenance costs are assumed to decrease by 1% annually.

• Sectoral demand is a function of regional GDP and the price of energy

$$D_{jr} = A_{jr} P_{jr}^{\alpha_{jr}} Y_r^{\beta_{jr}}$$

- where *j* represents sector and *r* the region
- *Y* is the level of GDP, taken as given.

#### Annual Income Projections by Region

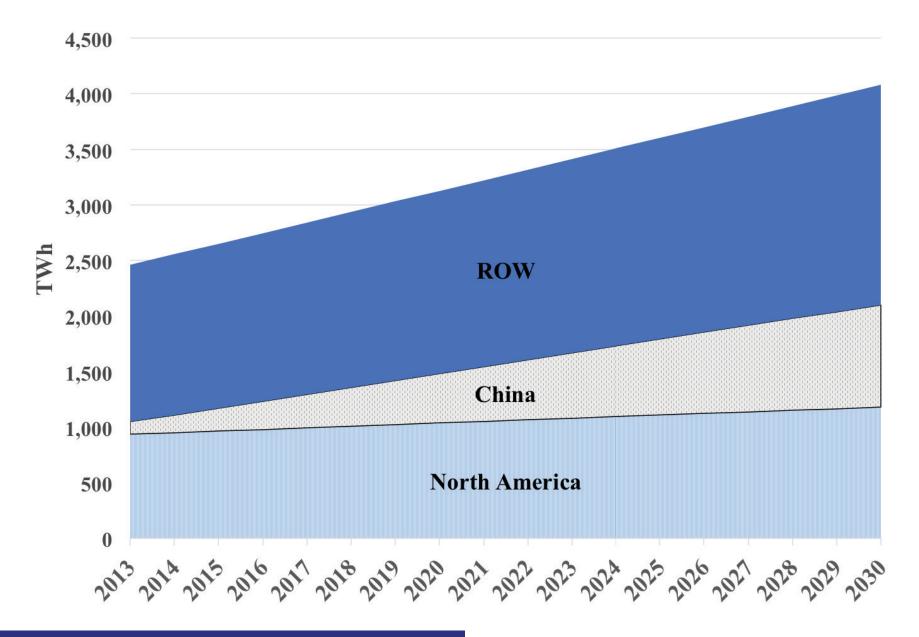

Source: (EIA, 2014)

#### Scenarios

- We define four models:
- Freeze in Chinese nuclear capacity at 112 TWh
- Nuclear Growth to reach 1029 TWh in 2030
- Impose a 65% intensity reduction from 2005-2030
- No intensity reduction

#### Planned Nuclear Growth

Ujjayant Chakravorty, Carolyn Fischer, Marie-Helene Hubert

#### Growth in Nuclear Power: Regional Targets

| Nuclear Generation (TWh) |       |       |  |
|--------------------------|-------|-------|--|
|                          | 2013  | 2030  |  |
| North America            | 936   | 1,179 |  |
| China                    | 112   | 1,029 |  |
| ROW                      | 1,412 | 1,979 |  |
| World                    | 2,460 | 4,080 |  |

Calculations based on IAEA (2014) projections.

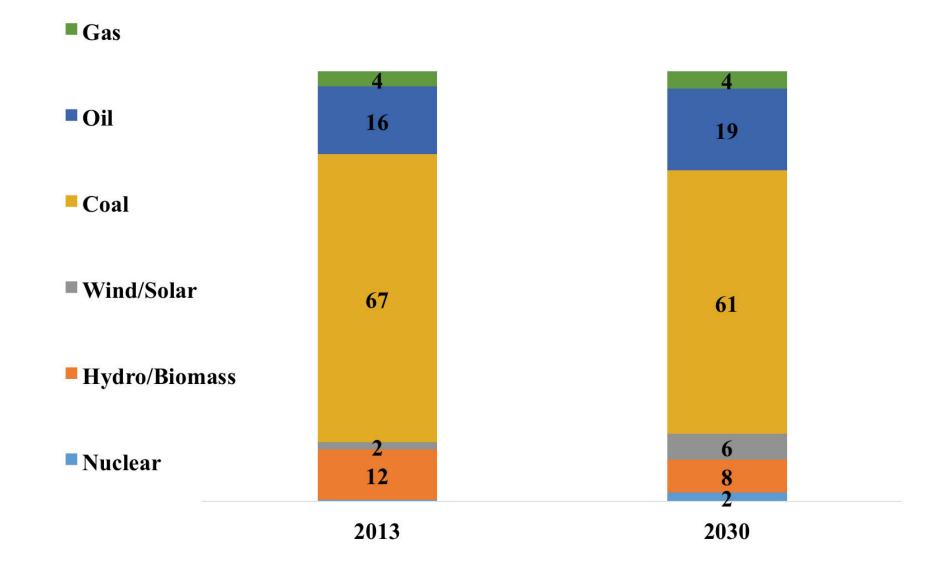

- First, We show baseline results: Nuclear Growth, No Intensity Target
- Next, we compare the four models

# Baseline Results : CO2 Emissions and Carbon Intensity 2013-2030

|      | CO2 Emissions | Carbon Intensity |
|------|---------------|------------------|
|      | (Btons CO2)   | (kg CO2/\$)      |
| 2013 | 9.83          | 0.98 (-8%)       |
| 2030 | 15.80         | 0.62 (-42%)      |

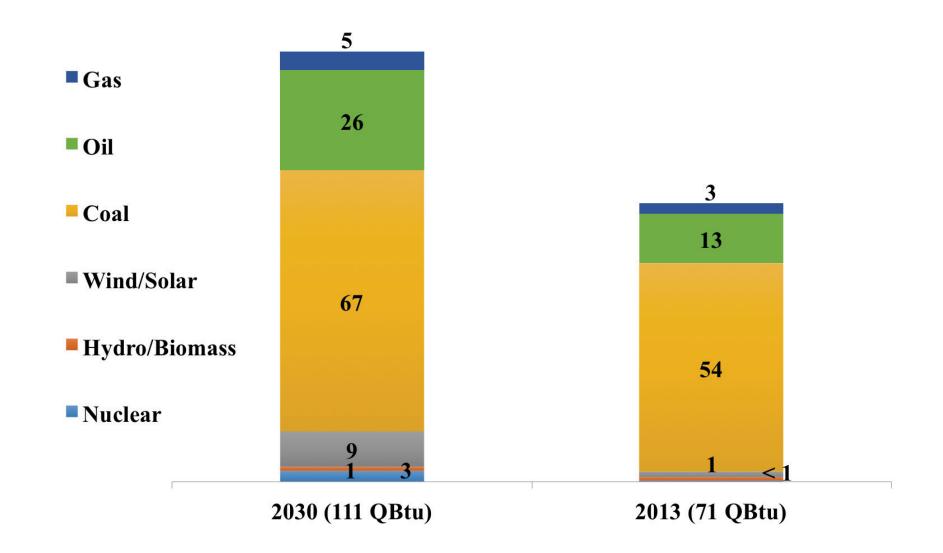

Emissions increase by 60% during 2013-30; Carbon Intensity in 2005 = 1.07. Reductions reported relative to 2005. Paris Commitment: 65% reduction

## Share of Fuel in Energy Output (2013-2030)

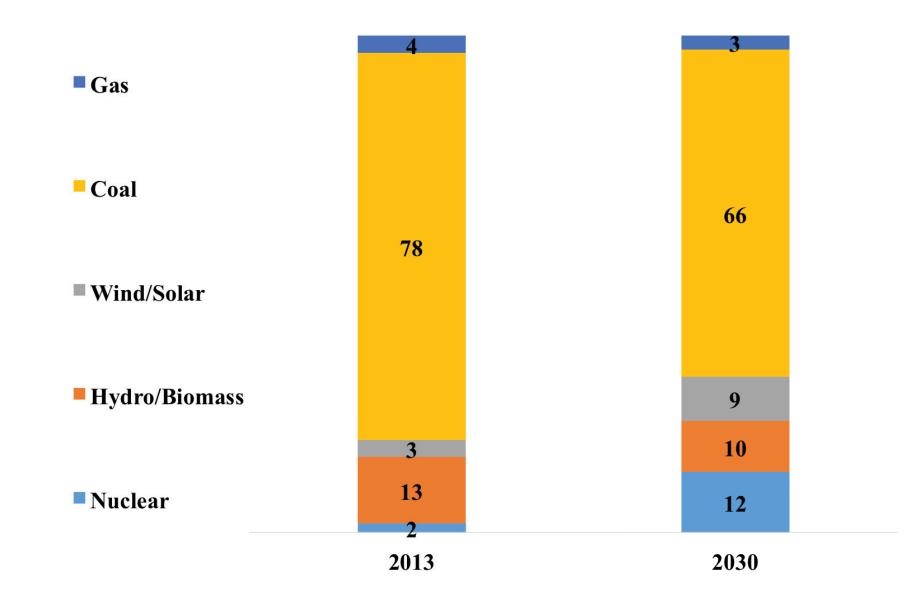

Ujjayant Chakravorty, Carolyn Fischer, Marie-Helene Hubert

#### Energy Output by Fuel (2013-2030)

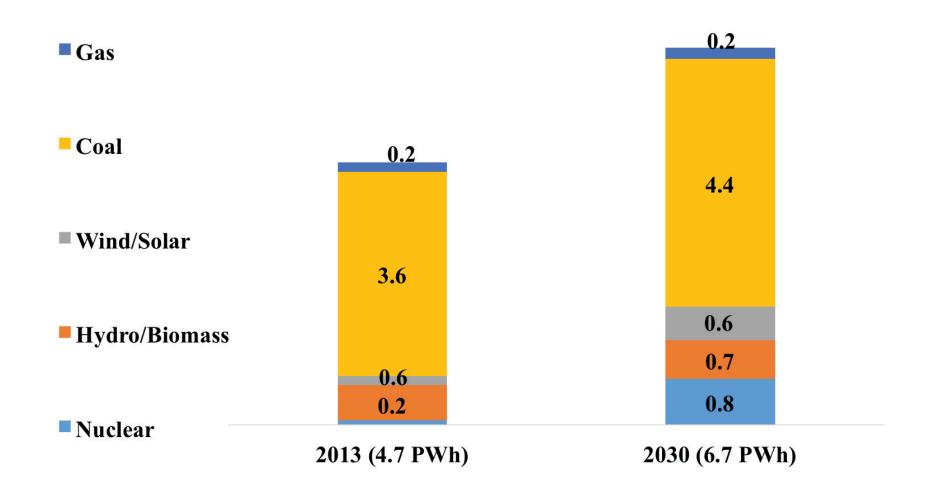

Ujjayant Chakravorty, Carolyn Fischer, Marie-Helene Hubert

## Share of Fuel in Electricity Generation (2013-2030)

| Medium Learning, No Intensity Target | 15.80                        | 0.62 (-42%)                     | _                          |
| Medium Learning, Intensity Target    | 9.62                         | 0.62 (-42%)                     | 74                         |
| High Learning, No Intensity Target   | 13.27                        | 0.52 (-52%)                     | _                          |
| High Learning, Intensity Target      | 9.62                         | 0.52 (-52%)                     | 50                         |

Carbon Intensity in 2005 = 1.07. These reductions (numbers in parenthesis) are relative to 2005. China's Paris Commitment: 65% reduction from 2005 levels. Tax in 2010 USD.

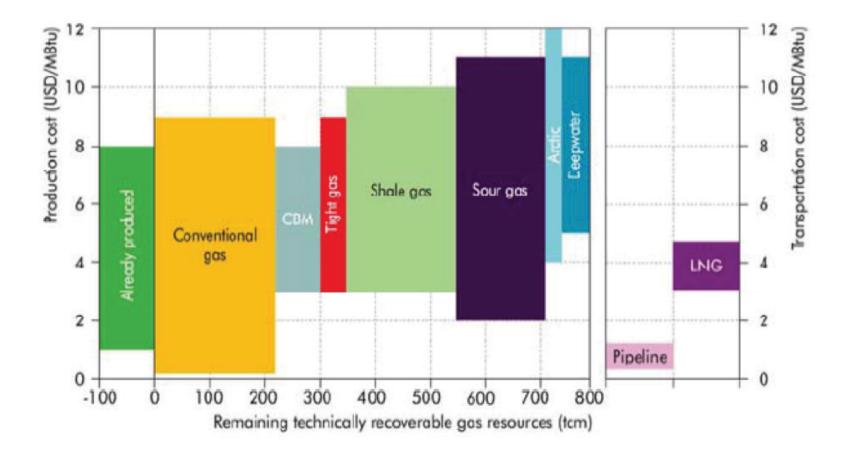

### Main Results

- Big Reductions in Coal Use but only with Carbon Tax
- Nuclear Alone Does not Deliver
- Nuclear does Crowd Out Renewables
- The implicit tax to reach the carbon intensity goal is about 75 US dollars per ton.
- Chinese policy has second order effects on other regions

- Include Spillovers from renewable energy use in China on rest of the world - include Trade in Renewables
- Include declining efficiency of solar with increased adoption
- Include Learning in other technologies
