# The Distributional Consequences of Large Devaluations 

Javier Cravino and Andrei A. Levchenko

Exchange Rates and External Adjustment Conference 2016, IMF-SNB

## Mexico Devaluation 1994

## Observations

1. Large devaluations followed by big changes in relative prices

- "At the dock" prices move with the exchange rate
- Low pass-through into retail prices
- Limited movements in non-tradeable prices

2. Households at different income levels consume different goods (Engel's Law, ..., Almås 2012)

This paper: Quantify the differential impact of large devaluations on the cost of living across the income distribution

## What we do

1. Construct income-specific price indices following the 1994 Mexican devaluation

- Monthly product-outlet level price data (28,675 goods in ~ 300 categories)
- Households expenditure surveys for 1994 and 1996

2. Theory and evidence linking observed changes in relative prices to the devaluation

- Use differences of distribution margins and prevalence of local goods to account for relative price changes

## Main findings

1. Across product categories

- The poor consume relatively more tradeables
- Inflation was 20 \% points higher for households in the bottom vs top income decile

2. Within product categories

- The poor consume cheaper varieties
- Inflation was between 13 and 21 \% points larger for those buying low- vs. high-priced varieties

3. Combined effect roughly additive

- 32 to $40 \%$ point difference in the cost of living change between top and bottom

## Mechanisms

The poor consume less non-tradeable goods

1. Spend less in non-tradeable categories (i.e. food vs education)
2. Across tradeable categories: Spend more in categories where distribution margins are low (i.e. food vs school supplies)

- Exception is cars
- Expenditure on local goods does not appear to vary systematically with income

3. Within categories: Purchase in low end outlets, that have lower distribution margins

- Differences in distribution margins can account for differences in price changes across varieties

## Data: Mexico 1994

- Individual price data underlying the CPI, monthly from January 1994 (Diario Oficial de la Federacion)
- Product $\times$ city $\times$ store: 28,675 prices in 282 product categories
- Product example: "Kellogg's, Corn Flakes, 500gr box"
- Household surveys, 1994 and 1996 (Encuesta Nacional de Ingresos y Gastos de Hogares)
- 597 consumption categories, mappable to price data

## Measurement

- Goods $g \in 1, \ldots, G$, varieties $v_{g} \in g \forall g$
- Aggregate price index:

$$
\widehat{P}_{t} \equiv \sum_{g \in G} \omega_{g} \widehat{P}_{g, t}
$$

where $\omega_{g} \equiv \frac{\sum_{h} P_{g, t_{0}}^{h} q_{g, t_{0}}^{h}}{\sum_{h} \sum_{g} P_{g, t_{0}}^{h} q_{g, t_{0}}^{h}}$ and $\widehat{P}_{g, t} \equiv \frac{1}{V_{g}} \sum_{v_{g} \in g} \widehat{P}_{v_{g}, t}$.

- Household-specific change in cost of living

$$
\widehat{P}_{t}^{h} \equiv \sum_{g \in G} \omega_{g}^{h} \widehat{P}_{g, t}^{h}
$$

where $\omega_{g}^{h} \equiv \frac{P_{g}^{h} t_{t_{0}}^{h} q_{g}^{h}}{\sum_{g} P_{g, t_{0}}^{h} q_{g, t_{0}}^{h}}$ and $\widehat{P}_{g, t}^{h} \equiv \sum_{v_{g}} s_{v_{g}}^{h} \widehat{P}_{v_{g}, t}$.

## Measurement

$$
\widehat{P}_{t}^{h} \equiv \sum_{g \in G} \omega_{g}^{h} \widehat{P}_{g, t}^{h}
$$

Across: $\widehat{P}$ for $h$ facing the average price change in each category

$$
\widehat{P}_{\text {Across }, t}^{h} \equiv \sum_{g \in G} \omega_{g}^{h} \widehat{P}_{g, t}
$$

Within: $\widehat{P}$ for $h$ with aggregate consumption shares facing $\widehat{P}_{g}^{h}$ in each $g$ :

$$
\widehat{P}_{\text {Within }, t}^{h} \equiv \sum_{g \in G} \omega_{g} \widehat{P}_{g, t}^{h}
$$

Difference between two households $\Delta \widehat{P}_{t} \equiv \widehat{P}_{t}^{h}-\widehat{P}_{t}^{h^{\prime}}$

$$
\Delta \widehat{P}_{t}=\Delta \widehat{P}_{\text {Across }, t}+\Delta \widehat{P}_{\text {Within }, t}+\Delta \widehat{P}_{\text {Cov }, t}
$$

## Across price index

$$
\widehat{P}_{A c r o s s, t}^{h} \equiv \sum_{g \in G} \omega_{g}^{h} \widehat{P}_{g, t}
$$

- $\omega_{g}^{h}$ by income decile from household expenditure survey
- $\widehat{P}_{g, t}$ construct disaggregated CPIs by product

## Across price index

| Oct. 94 | 1.00 | 1.00 | 1.00 | 1.00 | 1.00 | 1.00 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Oct. 95 | 1.51 | 1.42 | 1.45 | 1.51 | 1.45 | 1.47 |
| Oct. 96 | 1.95 | 1.76 | 1.82 | 1.98 | 1.80 | 1.85 |

## Expenditure differences within categories

- Unit values paid by household $h$ in category $g$ :

$$
u_{g, t}^{h} \equiv \frac{\sum_{v_{g} \in g} P_{v_{g}, t} q_{v_{g}, t}^{h}}{\sum_{v_{g} \in g} q_{v_{g}, t}^{h}}
$$

- Estimate

$$
\ln u_{g, t}^{h}=\alpha_{t}+\sum_{j=2}^{10} \beta_{j, t} \mathbb{I}_{[h \in \text { Dec. } j]}+\delta_{g, t}+\varepsilon_{g, t}^{h}
$$

- $\delta_{g, t}$ 's are category fixed effects
- Data on $u_{g}^{h}$ and income deciles from household surveys for 1994 and 1996

## Unit values and household income

|  | (1) | (2) | (3) | (4) |
| :---: | :---: | :---: | :---: | :---: |

| $R^{2}$ | 0.808 | 0.826 | 0.933 | 0.952 |

## Within price index

$$
\widehat{P}_{W \text { Within,t }}^{h} \equiv \sum_{g \in G} \omega_{g} \widehat{P}_{g, t}^{h}
$$

- $\omega_{g}$ : aggregate expenditure shares from household survey
- $\widehat{P}_{g, t}^{h}$ : Price index by category computed from the DOF
- Above/below median
- Issue: missing product categories in Diario data (45\% of expenditures)
- Conservative: no within effect in unmeasured categories
- Liberal: within effect equally strong in unmeasured as in measured categories

## Within

Conservative

Liberal

## Within

|  | Conservative |  |  | Liberal |  |
| :--- | :---: | :---: | :--- | :---: | :---: |
|  | Below | Above |  | Below | Above |

| Oct. 94 | 1.00 | 1.00 |  | 1.00 | 1.00 |
| Oct. 95 | 1.50 | 1.41 |  | 1.52 | 1.39 |
| Oct. 96 | 1.87 | 1.74 |  | 1.90 | 1.69 |

## Combined effects

$$
\widehat{P}_{t}^{h}=\sum_{g \in G} \omega_{g}^{h} \widehat{P}_{g, t}^{h}
$$

Two consumers:

- High-income: $\omega_{g}^{h}$ from the top income decile; $\widehat{P}_{g, t}^{h}$ above the median
- Low-income: $\omega_{g}^{h}$ from the bottom income decile; $\widehat{P}_{g, t}^{h}$ below the median

|  | Conservative |  |  | Liberal |  |
| :--- | :---: | :---: | :--- | :--- | :---: | :---: |

| Oct. 96 | 2.02 | 1.70 |  | 2.04 | 1.65 |

## Consumption of tradeables by household income

Mexico 1994

## Distribution margins by household income

Mexico 1994

## Local goods by household income

## Mexico 1994

Predicted vs. observed price changes: Oct. 94 - Sept. 95

## Taking stock

- Devaluations affect the prices of goods consumed by the rich and the poor differentially
- Anti-poor in Mexico 1994
- The poor appear to consume a higher true share of tradeables, both across and within goods
- Mechanisms likely more general for emerging markets

## Predicted vs observed price changes

|  | Devaluation: <br> Oct94 - Sept95 | Placebo I: <br> Jan94 - Oct94 | Placebo II: <br> Jan04 - Jan05 |
| :--- | :---: | :---: | :---: |
| Slope | $1.355^{* * *}$ | 0.108 | $-0.0865^{*}$ |
|  | $(0.287)$ | $(0.0788)$ | $(0.0519)$ |
| Observations | 4,193 |  |  |
| $R^{2}$ | 0.140 | 4,194 | 5,742 |

## Price dispersion

## EIU CityData

- 140 cities, 1990-, semi-annual frequency (March/April and September/October)
- 160 product categories $\times$ up to 3 stores: "supermarket/chain store," "mid-priced/brand store," "high-priced store"
- Intended to compute cost of living for expats
- No implicit or explicit expenditure shares

## Differences in distribution margins across outlets

Economist Intelligence Unit CityData, 3 store prices for each good

$$
\ln P_{v_{g}}=\beta_{M e d} M E D_{v_{g}}+\beta_{H i g h} H I G H_{v_{g}}+\alpha_{g}+\varepsilon_{v_{g}}
$$

|  | Log-difference in price |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | $\beta_{\text {Med }}$ | $\beta_{\text {High }}$ | N. prices | N. categories |
