Implementation of BPM6 by the Australian Bureau of Statistics

Prepared by the Australian Bureau of Statistics
Twenty-Fourth Meeting of the
IMF Committee on Balance of Payments Statistics

Sixth Edition by the Australian Bureau of Statistics

Paper Prepared by the Macroeconomics Research Section, ABS

Presented by Michael Davies
First Assistant Statistician, Macroeconomics and Integration Group, ABS
Introduction

The Australian Bureau of Statistics (ABS) implemented the Balance of Payments and International Investment Position Manual Sixth Edition (BPM6) and the System of National Accounts 2008 (2008SNA) with the release of statistics for September quarter 2009. The ABS was the first national statistical agency to implement the revised standards. The implementation coincided with the introduction in the Australian national and financial accounts of an update to the industrial classification used by the ABS and Statistics New Zealand. Managing two concurrent significant changes to Australia's macroeconomic statistics was a major challenge that involved many different parts of the organisation. The timing of the implementation coincided with the global financial crisis, which placed significant strain on existing statistical sources and methods and complicated the introduction of the new standards.

This paper outlines the processes used, and issues faced, by the ABS in this implementation. The paper presents a number of principles which the ABS adopted to guide the implementation and describes issues that created difficulties. It is hoped that this paper will provide insights to other national statistical organisations as they prepare to implement the new standards.

Organisational context

The ABS is Australia's national statistical organisation. The ABS compiles Australia's key macroeconomic statistics including the national accounts, the balance of payments, the international investment position, the financial accounts, government finance statistics and a range of prices indexes including the CPI.

The macroeconomic accounts are compiled within one broad organisational unit, the Macroeconomics and Integration Group. Source data for the accounts are drawn from areas within the Macroeconomics and Integration Group, other areas of the ABS and from a range of non-ABS sources.

The Standards

The international standards for macroeconomic accounts, apart from those for Government Finance Statistics, were updated concurrently. The new standards are presented in the BPM6 and 2008SNA. The Government Finance Statistics Manual is currently being revised. The ABS was a strong contributor to the development of BPM6 and 2008SNA. The ABS is supporting other countries to implement new international standards and through supporting the research agendas for the Balance of Payments and System of National Accounts.

The new standards are updates of the Balance of Payments Manual 5th edition and the System of National Accounts 1993, both of which were released in 1993. The updates were in response to the emergence of a number of new economic phenomena which arose or assumed greater importance as economies continued to develop in their complexity or have emerged as important measurement issues. These issues were initially described in the Information Paper:
Introduction of revised international standards in ABS economic statistics in 2009 (cat. no. 5310.0.55.001).

The Australian and New Zealand Standard Industrial Classification (ANZSIC 2006), which is compatible with the International Standard Industrial Classification of All Economic Activities, Rev.4 (ISIC Rev4), and the Standard Economic Sector Classifications of Australia (SESCA 2008) were introduced into ABS economic statistics at the same time as the new international standards.

Management of change process

The ABS decided that a clean, once-off cut-over would minimise instability in macroeconomic series induced by standards changes. The alternative approach would have resulted in instability over a period of several quarters, or even years, and a lack of coherence between the Rest of the world sector and the domestic sectors in the national accounts. Once this key decision was made, the work programs of a large number of statistical operations had to be coordinated, and a user consultation and communications program had to be developed. The approach came to be known as the "big bang" approach. It was recognised that this approach can be risky if not managed appropriately.

This approach was able to be managed in Australia as the ABS is responsible for the national accounts, the balance of payments and many of the data collections that feed into the macroeconomic accounts. Two senior internal ABS governance bodies were created and charged with the coordination. These were the ANZSIC Implementation Board, and the Macro-Economic Statistics Review Committee (MESC). There was some overlap of membership of these bodies to ensure coordination.

The role of the ANZSIC Implementation Board was to ensure that the implementation of the new classification was coordinated across the many data collections and datasets, as well as external data sources (e.g. the industry codes on the Tax Business Register). This was achieved by establishing implementation work programs and monitoring progress against those plans.

MESC was established to consider methodological changes in the macroeconomic accounts. MESC also considered changes in the SNA and BPM standards when drafts were circulated for comment by international agencies. It signed off, at a detailed level, methodological and conceptual changes across the macroeconomic accounts following finalisation of the standards. MESC included both senior and operational staff to ensure that the full implications of changes were understood and taken into account.

MESC determined a set of principles for implementing the changes in standards, reviewed proposals to depart from the standards, ensured that user communications plans were adequate, and reviewed implementation progress.

At the end of the implementation process the need for MESC ended. However, it was recognised that one of the roles of MESC, namely to oversee the introduction of new methodologies into the
compilation of macroeconomic accounts, was needed on an ongoing basis. A Macroeconomics Methods Board was set up to undertake this role.

**Principles behind the implementation**

There is a big investment in standards by the ABS including in the Balance of Payments Manual, System of National Accounts, industry classifications and a range of standards for most statistical measures. The ABS tries to influence the international standards as far as possible, accepts that compromises are made, then implement the standards to the fullest extent possible.

Building on the experience of implementing previous upgrades to the international standards and other significant changes, the ABS identified the following principles to guide the implementation.

(a) Standards

Departures from standards:

- should be few in number, demonstrate a significant benefit or avoidance of an unwarranted cost (for example, enhance harmonisation with Australian financial reporting standards; not possible for businesses to report the information within a reasonable cost)
- should be carried through all accounts/statistics (that is, no "local" departures) while being aware that some related standards, like Government Finance Statistics, are being updated on a different timetable
- enable a straightforward reconciliation with the standard where feasible
- Only be implemented after extensive consultation and publicity.

(b) Timing of implementation

- Changes impacting the current account should be implemented at the same time as changes to GDP (as far as practical) and in conjunction with the introduction of other related standards and classifications.
- Other changes to be made as practicable.

(c) Coordination and consultation

- The implementation must be centrally coordinated so that there is consistent treatment across the ABS and clients receive a consistent message about plans.
- Clients must be provided with sufficient opportunity to consider the changes being introduced and all clients must have equal opportunity to access this information.
Backcasting, bridging, parallel runs, seasonal adjustment

The ABS maintains long time series for national accounts and the balance of payments and international investment position. A large proportion of these series is maintained in original, seasonally adjusted and trend variations. The introduction of changes like 2008SNA and BPM6 resulted in shifts in the levels of component and total series. If the shift in level was sufficient to distort the seasonally adjusted time series, the ABS revised the historical series to make the time series as continuous as possible.

With some changes, like repairs moving from goods to services, it was relatively easy to adjust the time series. However, in some cases there was not sufficient detail available to adjust directly the historical series (e.g. the separate identification of technical reserves in the international investment position and the requirement for more detailed industry classes in the Property and business services division). In these cases a modelling technique was required.

Where it is not possible or necessary to maintain a long time series, the ABS adopted an approach of ‘bridging’ the current published estimates and the estimates produced by the revised methodology. This means that estimates on both the current and new basis were produced for one or more points in time and both sets of estimates are released along with analysis to help clients understand the differences between the series. This approach was used for the annual economic surveys. This technique is particularly relevant for many Balance of Payments Financial Account series, such as industry breakdowns of international investment, where it was not feasible to model beyond a certain time.

Because of the large number of changes to standards being implemented concurrently, together with improved methodologies and normal revisions, interpreting impacts or sources of the changes with any precision was not possible. This was not only a difficulty for users, but also an issue for quality assurance of outputs by the ABS.

Implementation timing

Changes to the international accounts, national accounts and their indicator series were implemented in respect of the 2008-09 or the September quarter 2009 reference periods. The changes were implemented in the August 2009 issue of International Trade in Goods and Services (cat. no. 5368.0) and the September quarter 2009 issue of Balance of Payments and International Investment Position, Australia (cat. no. 5302.0).

To accommodate additional processing required to compile the macroeconomic accounts according to the revised standards, the release of the September quarter 2009 issue of Balance of Payments and International Investment Position, Australia was delayed one week until Tuesday, 8 December. Subsequent issues of this publication were released according to standard timing.

The ABS chose a September quarter implementation as this coincided with both the release of the annual financial year publications, the start of a new financial year and the normal timing for introducing historical revisions.
Communicating with users

A comprehensive communication plan was developed consistent with the principle that the changes only be implemented after extensive consultation and publicity. The main features of this plan included:

· early presentation of the implementation plans to the Australian Statistics Advisory Council which is the key advisory body to the Statistician on statistical services
· early presentation of the implementation plans and updates on progress to the Economic Statistics User Group which is the key advisory body on economic statistics
· commencing in 2007, consultation with the key government agencies using macroeconomic statistics
· following this consultation, release in 2007 of an information paper to all stakeholders outlining the key SNA and BPM changes and the implementation plans
· release from June to September 2009 of an information paper for each of the affected publications describing the main changes impacting on that publication, the timing for implementing the changes, the impact on time series in the publication and the impact on the presentation of statistics in the publication; this included the provision of mock-ups of the publication and time series spreadsheets as they would appear after the implementation of the changes
· release in September 2009 of an information paper summarising the main changes and quantifying, to the extent possible, the impact on key aggregates; for some of the more significant changes detailed methodological information was provided
· inclusion in the first release of each publication of a comment on the statistical impacts of the changes.

The ABS produces a range of manuals describing the underlying concepts and structure of the key accounts like the Australian System of National Accounts and the Balance of Payments and International Investment Position. These manuals outline the sources, methods and terms used in compiling the accounts. The current editions of these publications reflect SNA93 and BPM5 concepts and a number of references to data sources and methods are out-of-date. The concepts, sources and methods documentation for the Balance of Payments and International Investment Position was partially revised in early 2011 with further updates planned over the rest of the year and early 2012.
Changes to data collections and systems

Apart from changes to data collections from ANZSIC06 changes, there were some changes in data collections to support BPM6. The changes to the Survey of International Investment were not significant for two reasons. First, the ABS form already collected data items that became part of the standard with BPM6 and only some new items (e.g. transactions between Direct Investment fellow enterprises) had to be added. The ABS tested the revised forms with a number of companies to ensure that the required information was understood and available. All companies in the survey were given early notice of the changes so that they could prepare their information systems and for the first quarter with the new forms they were despatched several weeks early. Second, the ABS decided that it was not feasible, at this stage, to collect all the additional supplementary items. Collecting supplementary information like country of ultimate investor would have required a fundamental change to the survey form and processing system which was not feasible.

Changes to some of the data models underlying International Investment were more significant than the changes to the directly collected survey data. These changes were both to address BPM6 requirements and to improve data not directly impacted by BPM6. For example, changing the Financial Intermediation Services Indirectly Measured (FISIM) to reflect better data availability for National Accounts and Balance of Payments, and to implement BPM6 treatment of FISIM (deducting FISIM from interest in the Primary Income Account).

Minimal changes to the Survey of International Trade in Services were required for BPM6 due to compliance with BPM5 and MSITS, the main changes were from switching classifications between the Goods Account and Services Account (merchanting, goods for processing etc.). In implementing the standards, a major issue was ensuring coherence between the National and International Accounts, which were simultaneously having standards updated in order to be released for the same reference period. In the case of merchanting, there was significant effort put into implementing the net export values into supply-use tables as no product information was available from survey collections, nor was it feasible to add questions.

The ABS produces a limited range of information on Foreign assets and liabilities by broad industry. The industry classification needed to be updated to ANZSIC06. This change was not a focus of planning and considerable remedial action was required to create a credible time series on an ANZSIC06 basis. The main cause of the difficulty was that the units selected in the International Investment Survey are not well represented on the ABS Business Register and therefore there was not a ready link to the ANZSIC06 classification for each unit. In addition there were some major movements in the industry based series (reflecting real world transactions) which were not correctly captured by the initial simple backcasting undertaken. The series is now available back to September 2006.

The ABS relies on administrative data from a number of government organisations including the Australian Taxation Office and the Australian Prudential Regulatory Authority (APRA), Australia's financial regulator, and maintains strong relationships with the organisations at both senior and operational levels. Changes to administrative data sources can require a considerably longer lead time than needed for changes to ABS surveys.
The ABS uses data from a suite of forms from APRA, Australia's financial regulator. The extent of changes required to these forms varied, with the Bank forms only requiring minor changes and the Registered Financial Corporations forms requiring more substantial changes. The changes to the Registered Financial Corporations forms have not yet been implemented but will be incorporated in a form review APRA commenced in 2011.

The main change driven from the implementation of new standards was the opportunity to review systems and processes for compiling the accounts. Opening up the Balance of Payments compilation series allowed the ABS to review how it modelled some estimates and made improvements to the way the series was estimated (for example reviewing the insurance model in Trade in Services). It also allowed the removal of redundant series such as the capital account entry for migrant transfers which was replaced by the Other Volume Change estimates for persons changing residency model (see case study in appendix 2).

Challenges for related outputs

The key change introduced with the BPM6 and 2008SNA classifications was the separate identification of money market funds and other investment funds. Institutions included as investment funds are those institutions which exhibit the following characteristics:

- pooling of investors' monies to purchase assets;
- assets are owned by a separate legal entity, such as a trust or company, which issues shares/units to investors on a proportional ownership basis;
- the fund/company must be open to the public, either via a prospectus or a distribution channel (e.g. a platform); and
- the investors are able to dispose of their units and/or shares within a reasonable period of time, on a well developed secondary market, such as a stock exchange or through readily accessible redemption facilities offered in association with the fund.

Funds displaying the above characteristics were classified to the relevant subsector, being either money-market funds, non-money market investment funds, or non-financial investment funds. Several institutions that pool investor funds were not classified as investment funds because they were either not open to the public (e.g. property syndicates) or did not have a sufficiently active secondary market for their units and/or shares (e.g. agricultural, film and timeshare trusts and venture capital development funds).

Only those investment funds investing predominantly in financial assets were treated as financial corporations. Those investing in non-financial assets, such as property, were treated as non-financial corporations. This distinction is based on whether the institution's primary income is obtained from rentals, or dividends and interest. This classification of non-financial investment funds was a minor departure from international standards.
Impacts and challenges implementing new international standards

The impact of BPM6 on the Balance of Payments and International Investment Position was smaller in comparison to the changes to Australia's national accounts. A number of differences between the 1993 SNA and BPM5, such as FISIM, had been addressed in Australia’s implementation of BPM5. Additionally, most of the changes were reallocating existing measures. For example, Australia collects some information on merchanting, goods for processing and repairs on goods. These were simple exchanges between goods and services accounts but further work needs to be done on some aspects of this work. There were minor changes to the net levels of services and income accounts due to the introduction of a pensions model, changes to the treatment of taxes and changes to financial services. In the case of Financial Intermediation Services Indirectly Measured (FISIM) the amount modelled was offset from interest which meant no impact on the current account.

There was virtually no impact on the Current Account balance (graph 1) and a small change to the history of Net International Investment Position (graph 2). The Net Foreign Debt measure (graph 3) remained stable under changes to BPM6, in part a reflection of existing data collected for the IIP and in part a reflection of the comprehensive series of accounts maintained by the ABS. The lower new series of Net International Investment Position and Net Foreign Debt were attributed to better foreign asset measures from implementing BPM6. There were changes to gross flows of IIP from the introduction of a new pension model and revisions to the insurance model. However, one of the more complex cases was the treatment of assets and liabilities of persons changing residency see the immigrant transfers case study in Appendix 2.

Although the headline aggregate levels saw little impact from the implementation of BPM6, some component series experienced significant changes due to new or revised methods of treatment. For example, while the level of Foreign assets saw little change overall, its component series (Direct investment, Portfolio investment etc.) were impacted by the different treatments under BPM6. As an example, Direct investment assets were reallocated into other components under the Foreign assets aggregate, resulting in large impacts to individual components but minimal net effect on the overall Foreign assets level.

User response to implementing new standards

Figure 2 - Timeline for implementation of new standards
Figure 2 shows the timelines for funding, planning and implementing BPM6 and other related standards, and the unfortunate coincidence of the final implementation with the onset of the global financial crisis. User reactions to the release of data compiled to the new standards were coloured by this coincidence. Analysts had to cope with new or significantly different series and interpreting their behaviour by attributing movement to economic phenomena or statistical phenomena. This was also a problem for the compilers of the national accounts.

Very close to the implementation date some users suggested that the implementation should be delayed. Delay would have required compilation of BPM5 and 1993 SNA accounts from data collected to BPM6 and 2008SNA standards.

The difficulties users were experiencing were reduced to some extent by the communication program the ABS had put in place to inform users in well advance about the nature of the changes, the likely impacts and the detailed changes to published tables, spreadsheets and other products. Even so this communication program did not reach all users and some were surprised. Others were aware that changes would occur, but the impacts on their work were not apparent until the data were released.

In addition to the turmoil in the economy due to the global financial crisis and the Government's reaction to it and the change in standards themselves, there was another impact of the changes in standards. Given the number of data collection and compilation systems that had to be revised to accommodate the standards, the opportunity was taken to improve data sources or methods to address known deficiencies. These quality improvements were impossible to separate out from the standards changes, and made the task of users forecasting or anticipating results more difficult.

Australia implemented a reasonably complete set of national accounts when implementing the 1993 SNA and BPM5. Therefore there was little "catchup" in moving to the 2008SNA and BPM6 by comparison with countries that may have omitted certain 1993 SNA features such as FISIM. Users were familiar with most 1993 SNA concepts and by and large attributed volatility in series during the global financial crisis to measurement difficulties rather than standards changes.

In summary, most users were more concerned with interpreting data in the context of the global financial crisis than issues to do with the new standards.

**International reporting obligations**

One issue that arose from Australia's early adoption of the new standards was how to report to international organisations. There is tension between publishing statistics to the new standards by the national statistical agency and the publication of statistics by international organisations for international comparability purposes, where not all countries report to the same standards. There are both policy and practical questions that arise.
The policy question is the desirability or otherwise of an international agency publishing key indicators different to those published by the national agency. Two sets of key indicators for a country will tend to confuse the economic debate, especially in the country concerned. Informing the domestic economic policy debate is the main reason for producing macroeconomic statistics by the national agencies concerned. International comparability is the main reason for international agencies publishing macroeconomic indicators for countries. Adjustment of one set of key indicators to a different standard will compromise one of the two objectives. The ABS has found it difficult to negotiate a satisfactory outcome on this policy question with the agencies concerned.

Some of the more detailed international manuals (e.g. the Manual of Statistics on International Trade in Services or the Government Finance Statistics Manual) were not available when the new accounts were being compiled. As a consequence, the ABS needed to choose between the more detailed presentations from these manuals and using the core of the new standards. This means that the ABS will need a separate process to implement more detailed presentations based on these manuals.

The ABS underwent a Review of Observance on Standards and Codes by the IMF in 2010. In the review only a handful of recommendations were supplied for Australia’s Balance of Payments, none of which were of critical importance to the collection. This would suggest that a comprehensive approach to collections, systems and compilation benefits adherence to international requirements.

Managing macroeconomic accounts in a volatile environment

From 1992 to the mid 2000s Australia enjoyed a long period of sustained and stable growth. In parallel with the economic phenomena, the compilation effort for macroeconomic accounts was similarly stable. This changed dramatically with the onset of the global financial crisis in 2007 and through 2008 when economic volatility disturbed longstanding relationships. This period coincided with the introduction of new standards for economic accounts (see the timeline graphic earlier in this note) and also retirement of some of the more experienced members of the compilation team. Many of the compilation team during this period had never experienced an economic downturn. An additional challenge during this period was the volume and price measurement of exports of major commodities. In short there was considerable volatility in both the economic environment and the national accounts workplace. Since then the volatility has continued, for example:

- 2007 - 2008 onset of the global financial crisis
- 2008 - 2010 various government measures to counteract the crisis
- 2009 - 2011 significant natural events (break of drought, floods, fires, cyclones, earthquakes, tsunamis) in Australia and regionally
- 2010 - 2011 sovereign debt concerns on international financial markets
Looking forward, there are significant challenges to macroeconomic statistics in global conditions and the likelihood of further volatility. These challenges will make compilation of macroeconomic accounts more difficult than was experienced prior to 2007. The lesson the ABS wishes to pass on to those implementing the new standards in this volatile environment is to plan ahead carefully and be prepared to cope with the unexpected.

**Future developments**

It appears that Canada and USA will probably convert to BPM6 and 2008SNA in 2013 and European Union countries in 2014. This may result in the emergence of best methodological practice closer to these dates as these countries consider their implementation in detail.

</tr>
<tr>
<td>Chapter 8. Financial Account</td>
<td>The column headings are changed to net acquisitions of financial assets and net incurrence of liabilities (instead of credits and debits, respectively) consistent with their contents. Consequently, negative signs are not used for an increase in assets and positive signs are not used for a reduction in assets (paragraph 8.1, Table 8.1, also paragraph 3.31).</td>
</tr>
<tr>
<td></td>
<td>Reinvestment of earnings in investment funds is recorded in the financial account (paragraph 8.28 and also paragraphs 11.37–11.39 for the corresponding income entry; BPM5 paragraphs 277–278).</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Chapter 10. Goods and Services Account</td>
<td>Goods for own use or to give away acquired by travellers that are in excess of customs thresholds are included in general merchandise, rather than travel (paragraphs 10.20 and 10.90; BPM5 paragraph 242). Work in progress.</td>
</tr>
<tr>
<td></td>
<td>A reconciliation table is introduced to show the relationship between international merchandise trade statistics and goods on a balance of payments basis (paragraphs 10.55–10.56, Table 10.2). Partially implemented. Confidentiality constrains the full reconciliation table.</td>
</tr>
<tr>
<td></td>
<td>The classification of acquisition of goods and services by nonresident construction enterprises in the economy in which they are working is changed to show separately construction abroad and construction in the compiling economy on a supplementary basis. Goods and services acquired locally are included under this heading, previously under other business services. The inclusion of buildings (excluding the land component) is clarified as being under construction. As a result of these changes, the title of the item is construction, rather than construction services (paragraphs 10.101–10.108, BPM5 paragraph 254). Work in progress.</td>
</tr>
<tr>
<td></td>
<td>Services of asset-holding entities to their owners, where asset management costs are taken out of income, are recognized (paragraphs 10.124–10.125). Not identifiable in data.</td>
</tr>
<tr>
<td></td>
<td>FISIM and other implicit financial services have been included in services, with a method for calculation based on the reference rate (paragraphs 10.126–10.136; footnote to BPM5 paragraph 258). FISIM has been improved, but the ABS bases FISIM on reported income flows, rather than asset and liability stock levels, to ensure consistency with reported income.</td>
</tr>
<tr>
<td></td>
<td>The results of research and development (such as patents, copyrights, and industrial processes) are treated as produced assets included in research and development services (previously treated as nonproduced assets and shown in the capital account) (paragraph 10.148; BPM5 paragraph 358). Work in progress.</td>
</tr>
<tr>
<td></td>
<td>Audiovisual services are delineated from goods, and the relationship between different kinds of licenses for intellectual property is explained (paragraphs 10.162–10.166 and Table 10.4; BPM5 paragraph 265). Not implemented due to measurement challenges.</td>
</tr>

</table>
## Chapter 11. Primary Income Account

The treatment of index-linked debt instruments is clarified and modified (paragraphs 11.50(c) and 11.59–11.65; BPM5 paragraph 397).

Some of the treatments are not relevant under the creditor principle.

<table>

<tr>
<th>Description</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fees on securities lending and gold loans are clarified and treated as interest (paragraphs 11.67–11.68).</td>
<td>Partially implemented. There are some data constraints</td>
</tr>
<tr>
<td>Rent is identified as a component of primary income (paragraph 11.85; previously part of other investment income).</td>
<td>Partially implemented. There are some data constraints</td>
</tr>
<tr>
<td>Taxes and subsidies on products and production are classed as primary income, not current transfers (paragraphs 11.91–11.92; BPM5 paragraph 299).</td>
<td>Partially implemented. There are some data constraints</td>
</tr>
</tbody>
</table>

## Chapter 12. Secondary Income Account

The treatment of insurance claims and net premiums and of standardized guarantees is specified (paragraphs 12.41–12.46; BPM5 paragraph 257).

Implemented with improved data.

<tbody>
<tr>
<td>Clarification is made on technical assistance as a part of investment projects to be classified as capital transfers (paragraph 12.50).</td>
<td>Work in progress.</td>
</tr>
<tr>
<td>The concepts of (1) personal remittances, (2) total remittances, and (3) total remittances and transfers to NPISHs are introduced (paragraph 12.27).</td>
<td>Not implemented due to data constraints for (1) &amp; (3).</td>
</tr>
</tbody>
</table>

## Chapter 13. Capital Account

Insurance claims may be treated as capital transfers in the case of catastrophes (paragraph 13.24; BPM5 paragraph 257).

Implemented in principle, but no catastrophes have yet occurred.

Appendix 2

Case study

*Migrant transfers (OVC due to persons changing residency)*

Migration is the movement of a household unit from one economy to another for an intended period of more than one year. Migrants are covered in the calculation of Net Overseas Migration for population estimates; however, the movement of their personal effects, assets and liabilities need to be accounted for. Under Balance of Payments Manual fifth edition (BPM5), this wealth was treated as a capital transfer and limited to personal effects and assets carried across the border. The Balance of Payments and International Investment Position Manual sixth edition (BPM6) revises the treatment of the transfer of assets and liabilities of persons and other entities changing their economy of residence.

Household assets in the National Accounts are classified into financial and non-financial assets with property (dwellings and land) included as non-financial assets. The national accounts household balance sheet shows property representing about 60% of household assets. BPM6 requires the creation of a notional resident unit as an owner of the land and buildings. This notional resident unit then is defined as a quasi-corporation. This treatment is designed so that land and other non-relocatable assets such as natural resources are always assets of the economy in whose territory they are located. Otherwise, the land would appear in another economy’s national balance sheet. Therefore property assets (dwellings and land) will be included as part of equity in non-resident unincorporated corporations. 2008SNA treatment will be the same but changes to household non-produced assets, financial assets and income flows need to be adjusted. Based on asset transfer information obtained from the third Longitudinal Survey of Immigrants to Australia, about 60% of settler arrivals transfer assets during their first year of stay. It is assumed that all permanent migrants transfer or otherwise dispose of foreign held assets within two years of migration. The initial 'other change' and resulting position will be amortised through transactions over a two year period. It is assumed that the same pattern of transfer and disposal applies to resident permanent departures as there is no information about the transfer of assets by residents. It was assumed that migrants changing residency long term generally hold onto their original assets as they would be returning to their country of origin.

An estimate of the number of households arriving and departing permanently is required to avoid allocating household assets to every man, woman and child that changed residency. For arrivals, the proportion of primary applicants to total arrivals was used to determine the number of households arriving. This information was obtained from the Department of Immigration and Citizenship (DIAC). Household formation rates by age group from the ABS publication Household Wealth and Wealth Distribution (cat. no. 6554.0), were applied to departures to determine the number of households departing.

The next layer of complexity for the persons changing residency model was how to conceptually measure long-term migration patterns. Under BPM6 long-term residents (those with the intention to domicile within an economy for more than 12 months) are treated similarly to permanent migration. In contrast to permanent migrants the assumption that migrants run down their assets...
over two years does not hold. It was assumed that long-term migrants generally hold onto their original assets as they would be returning to their country of origin. Accordingly treatment of changes made to household non-produced assets, financial assets, income flows and tax treatment from these assets were implemented in the National Accounts and Balance of Payments.
