World hunger spiked sharply in 2009, significantly worsening an already disappointing trend in global food security since 1996. The combination of food and economic crises has pushed the number of hungry people worldwide to historic levels. The Food and Agriculture Organization of the United Nations (FAO) estimates that 1.02 billion people were undernourished in 2009—about 100 million more than in 2008. As a result, reaching the World Food Summit target and the Millennium Development Goal for hunger reduction looks increasingly out of reach.

**Hunger on the Rise**

**Number of hungry people tops one billion**

Combined food and economic crises drove the number of hungry people above one billion in 2009

**The proportion of undernourished people has risen to almost 20 percent**

The proportion of undernourished people has risen to almost 20 percent (percent of world population) in the past few years. The FAO estimates that total cereal production in 2009 was only slightly below the record high set in 2008. Instead, the increase in hunger is mainly a result of poor people's inability to afford the food that is produced. Many drew down savings during the food price crisis and have now lost jobs as a result of the global economic crisis.

Food prices increased considerably in developing countries during the 2006–08 world food crisis and were still high when the economic crisis started. Domestic prices of staple foods were typically 17 percent higher at the end of 2008 than two years earlier, after adjusting for inflation. This seriously hurt the purchasing power of poor consumers, who often spend 40 percent of their income on staple foods.

Thus, the global economic crisis hit developing countries at a very bad time. It further reduced access to food by lowering employment opportunities, remittances from abroad, development aid, foreign direct investment, and export opportunities.

**Prevalence of undernourishment around the world**

Prevalence of undernourishment around the world (percent of population, 2004-06)

- How can hunger be eliminated?
- Improving world food security calls for both measures for immediate relief and more fundamental structural changes. In the short term, safety nets and social protection programs must be improved to reach those most in need.

In the medium and long term, the structural solution to hunger lies in increasing agricultural productivity to increase incomes and produce food at lower cost, especially in poor countries. The importance of longer-term measures is evidenced by the unacceptably high number of people who did not get enough to eat before the crises and are likely to remain hungry even after the food and economic crises have passed. In addition, these measures must be coupled with better governance and institutions at all levels. For example, at the global level, the reformed Committee on World Food Security marks an important step toward building coherence in actions and policies to improve food security.

**Hunger affects**

All regions of the world. Asia and the Pacific, the world’s most populous region, has the highest number of hungry people. However, hunger is most prevalent in sub-Saharan Africa, where about one-third of the population is undernourished.

**Poor harvests**

Are not to blame. The FAO estimates that total cereal production in 2009 was only slightly below the record high set in 2008. Instead, the increase in hunger is mainly a result of poor people’s inability to afford the food that is produced. Many drew down savings during the food price crisis and have now lost jobs as a result of the global economic crisis.

Food prices increased considerably in developing countries during the 2006–08 world food crisis and were still high when the economic crisis started. Domestic prices of staple foods were typically 17 percent higher at the end of 2008 than two years earlier, after adjusting for inflation. This seriously hurt the purchasing power of poor consumers, who often spend 40 percent of their income on staple foods.

Thus, the global economic crisis hit developing countries at a very bad time. It further reduced access to food by lowering employment opportunities, remittances from abroad, development aid, foreign direct investment, and export opportunities.

**Nearby all of the world’s undernourished live in developing countries**

- Asia and the Pacific (422)
- Latin America and the Caribbean (53)
- Near East and north Africa (42)
