Progress towards the international development goals
Poverty in all its forms is the greatest challenge to the international community. Of special concern are the 1.2 billion people living on less than $1 a day and the additional 1.6 billion living on less than $2 a day.

Setting goals to reduce poverty is an essential part of the way forward. Building on the global United Nations conferences and summits of the 1990s, the development goals described in this report are broad goals for the entire world. They address some of the many dimensions of poverty and its effects on people’s lives. In accepting these goals, the international community makes a commitment to the world’s poorest and most vulnerable—and to itself.

The goals are set in precise terms—measured in numbers to ensure accountability. The openness and transparency of such numbers can help us chart a course to achieve the goals and track progress. But people are not numbers—happiness is not a statistic. These goals are worthwhile because they will improve the quality of human life. The world will be better, and safer, for its 6 billion people and for the projected 7 billion people in 2015.

Goals cannot be imposed—they must be embraced. Each country must identify its own particular goals, its own path to development, and make its own commitment through dialogue with its citizens. In this, the support of the international community is vital. And the high-income countries, because of their greater resources, have much to contribute.

It is essential for all the partners in this development effort to pursue faster, sustainable growth strategies that favour the poor. To spend efficiently—avoiding waste and ensuring that the mechanisms for accountability are always in place. To spend effectively—on activities aimed at human, social and economic development, not on excessive military capacity or on environmentally disastrous projects. And to spend wisely—not committing public resources to activities that can be best undertaken by the private sector.

What are the obstacles? Weak governance. Bad policies. Human rights abuses. Conflicts, natural disasters and other external shocks. The spread of HIV/AIDS. The failure to
address inequities in income, education and access to health care, and the inequalities between men and women.

But there is more. Limits on developing countries’ access to global markets, the burden of debt, the decline in development aid and, sometimes, inconsistencies in donor policies also hinder faster progress.

What will it take to overcome these obstacles? True partnership—and a continuing commitment to eliminate poverty in its many dimensions. Our institutions are actively using these development goals as a common framework to guide our policies and programmes and to assess our effectiveness. We cannot afford to lose the fight against poverty. And we must be unshakeable in our unified desire to win that fight—for everyone.

Kofi A. Annan
Secretary-General of the United Nations

Donald J. Johnston
Secretary-General of the Organisation for Economic Co-operation and Development

Horst Köhler
Managing Director of the International Monetary Fund

James D. Wolfensohn
President of the World Bank Group
The goals for international development address that most compelling of human desires—a world free of poverty and free of the misery that poverty breeds. The goals have been set in quantitative terms, so part of the story is told in words and pictures, but most of it is in numbers and charts.

The goals come from the agreements and resolutions of the world conferences organised by the United Nations in the first half of the 1990s. These conferences provided an opportunity for the international community to agree on steps needed to reduce poverty and achieve sustainable development.

Each of the seven goals addresses an aspect of poverty. They should be viewed together because they are mutually reinforcing. Higher school enrolments, especially for girls, reduce poverty and mortality. Better basic health care increases enrolment and reduces poverty. Many poor people earn their living from the environment. So progress is needed on each of the seven goals.

The goals will not be easy to achieve, but progress in some countries and regions shows what can be done. China reduced its number in poverty from 360 million in 1990 to about 210 million in 1998. Mauritius cut its military budget and invested heavily in health and education. Today all Mauritians have access to sanitation, 98% to safe water, and 97% of births are attended by skilled health staff. And many Latin American countries moved much closer to gender equality in education.

The message: if some countries can make great progress towards reducing poverty in its many forms, others can as well. But conflict is reversing gains in social development in many countries in Sub-Saharan Africa. The spread of HIV/AIDS is impoverishing individuals, families and communities on all continents. And sustained economic growth—that vital component for long-run reductions in poverty—still eludes half the world’s countries. For more than 30 of them, real per capita incomes have fallen over the past 35 years. And where there is growth, it needs to be spread more equally.

So, the goals can be met. But it will take hard work. Success will require, above all, stronger voices for the poor, economic stability and growth that favours the poor, basic social services for all, open markets for trade and technology and enough resources for development, used well.
1. Reduce the proportion of people living in extreme poverty by half between 1990 and 2015
As growth increased globally in the mid-1990s, poverty rates fell—rapidly in Asia, but little or not at all in Africa. Income inequality is a barrier to progress in Latin America.

2. Enrol all children in primary school by 2015
Although enrolment rates continue to rise, they have not risen fast enough. On current trends, more than 100 million school-age children will not be in school in 2015.

3. Make progress towards gender equality and empowering women, by eliminating gender disparities in primary and secondary education by 2005
Getting more girls through school is essential but not enough. The gender gap may be narrowing, but girls’ enrolments remain persistently behind those of boys.

4. Reduce infant and child mortality rates by two-thirds between 1990 and 2015
For every country that cut infant and under-5 child mortality rates fast enough to reach the goal, 10 lagged behind—and another one moved backwards, often because of HIV/AIDS.

5. Reduce maternal mortality ratios by three-quarters between 1990 and 2015
Skilled care during pregnancy and delivery can do much to avoid many of the half million maternal deaths each year. But the proportion of births attended by skilled personnel rose slowly in the 1990s.

6. Provide access for all who need reproductive health services by 2015
Contraceptive use is one indicator of access to reproductive health. With progress in access to reproductive health services, the rate of contraceptive use is rising in all regions.

7. Implement national strategies for sustainable development by 2005 so as to reverse the loss of environmental resources by 2015
Despite their commitments at the Rio Earth Summit in 1992, fewer than half the world’s countries have adopted strategies, and even fewer are implementing them.
Goal: Halve the proportion of people living in extreme poverty by 2015

Across the globe 1 person in 5 lives on less than $1 a day—and 1 in 7 suffers chronic hunger

Poverty

In many developing countries, the poor struggle at the margin of the formal economy. They lack political influence, education, health care, adequate shelter, personal safety, regular income and enough to eat.

Progress in some regions—delays and setbacks in others

Proportion of people living on less than $1 a day (%)

Worldwide the number and proportion of people living in extreme poverty declined slightly through the mid-1990s. Most of the decline was in East Asia, notably China. But progress slowed temporarily in some Asian countries in the late 1990s, and ground to a halt or reversed in others. In the rest of the world, while the proportion of people in poverty declined, population growth meant that the number of poor people increased. And in the countries of the former Soviet Union, undergoing economic and social transition, the proportion of poor more than tripled.

Poverty is pain; it feels like a disease. It attacks a person not only materially but also morally. It eats away one’s dignity and drives one into total despair.
Between 1988 and 1996, Thailand’s economy grew by 7% a year, and the share of the population in poverty dropped from 22% to 11%. But the country’s financial crisis pushed that share back up to 13% in 1998. In response, Thailand is redirecting its development strategy to reduce inequality, which remained high despite all the growth. The country’s development plan, now more people-centred, has increased resources to the poorer north and north-east. The objective: to reduce poverty to less than 10% by 2001. A new social investment fund helps create jobs and supports social services for the poor. As part of the new strategy, governance reforms are geared to increasing accountability and giving authority to local district councils, which now elect their own officials and command greater resources.

The numbers of poor are greatest in South Asia, but the proportion of poor people is highest in Sub-Saharan Africa. Most of the poor live in rural areas, but urban poverty is growing faster. Women are more likely than men to lack rights to land and other assets. They also have difficulty getting access to credit. And they lack adequate employment and economic security in old age.

Malnutrition is a symptom of poverty. Today there are 150 million underweight children in the developing world. But the proportion is falling everywhere except Africa. Being underweight, even mildly, increases the risk of death and inhibits mental and physical development. The problem perpetuates itself from one generation to the next, because malnourished women are more likely to have low-birthweight babies.

Poverty rates can be cut in half by 2015 if countries follow policies that reduce social and gender inequalities and create income-earning opportunities for the poor. But meeting the goal is only a first step, because almost 900 million people will still be left in extreme poverty. That is why the effort to eliminate poverty needs to be intensified.
Goal: Enrol all children in primary school by 2015

Education

Providing universal primary education remains a great challenge—and a great opportunity. Success will give millions more the skills to rise out of poverty. But failure will fuel an educational—and social—crisis in the decade ahead.

Enrolment rates are up in most regions, but the quality of education has been suffering—and far too many children remain out of school. To increase enrolments and provide better education, school systems have to invest in training teachers and improving facilities. They also have to increase family and community participation—and eliminate gender bias that limits the demand for girls’ education.

I want to learn to read and write, get good work, so that I can send my children to a good school, so that they will be able to get good work.
Education reform in Malawi

In 1994 Malawi made primary education its top priority—addressing poor access and inequality, high repetition and dropout rates and poor infrastructure in its school system. More government money for schools and the elimination of fees boosted enrolments by 50% and focused Malawi’s education system on helping the poor. In 1994–95 the poorest fifth of the population received 16% of all public education spending, up from 10% in 1990–91, while the share going to the richest fifth declined from 38% to 25%.

In most countries, disparities in enrolment rates continue between rich and poor. For some countries, primary education is practically universal—for others, attainment is dismal. Low retention rates reflect poor schools, poor access and the cost to the poor of keeping their children in school.

Because of declining birth rates, the world’s school-age population will increase by only 9 million in the next 15 years. But there are large regional differences. As a result of reduced fertility rates in East Asia, the school-age population there will decline by 22 million. But in Sub-Saharan Africa it will rise by 34 million. Added to the 47 million not now in school, that means building schools, training teachers and providing textbooks for an extra 81 million children in the next 15 years. South Asia and the Middle East and North Africa also face significant challenges.
**Goal:** Empower women and eliminate gender disparities in primary and secondary education by 2005

**Gender equality**

Educated girls have many more choices—in marriage, in childbearing, in work, in life. They can seize more economic opportunities. And they do more to shape their society’s political, social, economic and environmental progress.

Girls’ enrolments have increased faster than boys’. In such countries as Armenia, Mongolia, South Africa, Sri Lanka and Venezuela, their school enrolment rates even exceed those of boys. At the global level, the gender gap in primary and secondary enrolment is narrowing. But the current rate of progress is not fast enough to close the gender gap in education by 2005.

“When we came here, we could not write or read anything, we sat in circles like stones and hardly made any response. Now we know how to read and write letters, we are aware of our rights and needs.”
Between 1991 and 1998, girls’ primary school enrolment in Guinea increased from fewer than 20% to almost 40%. That was the result of a series of practical interventions by the government. It equipped schools with girls’ latrines. It permitted pregnant girls to be readmitted after childbirth. It distributed textbooks free of charge and updated textbooks to remove any gender bias. And it focused on hiring female teachers.

In recent years the gap between girls’ and boys’ secondary enrolments has narrowed, reflecting the higher enrolments of girls and the greater tendency for boys to leave school early. But even as the gender gaps in education decline, they persist in economic and political life.

In many places, children of the wealthiest families are as likely to finish their schooling as those in high-income countries. For those families the proportion of girls in school is roughly the same as that of boys. But for poor families fewer of their children go to school—and far fewer girls than boys. For many poor families the value of girls’ labour exceeds the returns they expect from educating their daughters—so daughters don’t go to school.
**Goal:** Reduce infant and child mortality rates by two-thirds by 2015

**Infant and child mortality**

Infant and under-5 mortality rates fell by more than half between 1960 and 1990. In China, Sri Lanka and Vietnam infant mortality fell by three-quarters—good reason to hope that such success can be repeated in other poor countries. But progress slowed in the 1990s. And in most regions, a big effort will be needed to attain a two-thirds reduction by 2015.

**The outlook for children—improving, but too slowly**

Under-5 mortality rates (deaths per 1,000 live births)

What stands in the way? Unsafe water. Inadequate immunisation. War and civil conflict. High levels of poverty and malnutrition. Poor access to basic education, especially for girls. The spread of HIV/AIDS and the resurgence of malaria and tuberculosis.

---

**The boy died of measles. We all know he could have been cured at the hospital. But the parents had no money, and so the boy died a slow and painful death.**
Bangladesh reduced infant and under-5 mortality rates by about 25% between 1990 and 1998. A remarkable achievement, although not quite fast enough to reach the goal by 2015. What did it take? A focus on immunisation. National awareness campaigns on the treatment of diarrhoea. Special programmes to reduce pneumonia-related deaths. Better sanitation and better access to safe water. Also important were strong community participation in the delivery of basic social services, special scholarships for girls and the expansion of microcredit for women.

Infant deaths are most often the result of unhealthy conditions around the time of birth. Pneumonia, diarrhoea, malaria or measles frequently kill young children, especially those suffering from chronic malnutrition.

More poor children die
Under-5 mortality rates (deaths per 1,000 live births) by family assets

Under-5 mortality rates are highest among the poorest, but they are high even for the relatively wealthy. Reducing infant and child deaths depends on greater investments in basic social services and on educating parents and improving nutrition, especially for the poor.

Education empowers women to have smaller families, to provide better care for their children and to pass on knowledge that will improve their children’s lives.
Goal: Reduce maternal mortality ratios by three-quarters by 2015

Maternal mortality

More than 500,000 women died during pregnancy and childbirth in 1995—and many millions more suffered without treatment.

Ninety-nine percent of maternal deaths occur in developing countries, most of them preventable. Infections, blood loss and unsafe abortion account for the majority of deaths. To reduce maternal mortality, more investment in health systems is needed to improve the quality and coverage of delivery services and to provide prenatal and postnatal care for the poor.

Maternal deaths are hard to measure. The proportion of births attended by skilled personnel helps to track progress in reducing maternal mortality. In regions where skilled attendants are not routinely available, the goal is to have skilled attendants at 90% of births by 2015.

I am going to the sea to fetch a new baby, but the journey is long and dangerous, and I may not return.
We know what to do to reduce maternal mortality. The necessary services include family planning, basic maternal care, skilled birth attendants, neonatal care and preventing and treating unsafe abortions and the complications of pregnancy and delivery. And we know the cost—about $3 a person a year in low-income countries. Despite their low incomes, China, Cuba and Sri Lanka have all reduced maternal deaths through efforts to improve access to primary health care, strengthen health systems and improve the quality of health care.

Maternal mortality varies widely in the world’s regions—low in Latin America, but very high in Africa. In many poor African countries, one mother dies from complications of pregnancy and delivery for every 100 live births.

Health workers with midwifery skills are the key to reducing maternal mortality. As well as attending births, they provide mothers with basic information about prenatal and postnatal care for themselves and their children. Improving women’s social status and ensuring gender equity in health care are important in achieving this goal.
**Reproductive health**

Reproductive health services provide men and women with the knowledge they need to protect their health and the health of their families. This includes methods for planning their families, preventing and treating sexually transmitted diseases, including HIV/AIDS, and discouraging harmful practices against women.

The use of contraception is influenced by many factors, especially access to and knowledge of affordable and quality reproductive health services. And because gender relations affect reproductive health, men need to take greater responsibility for their own sexual behaviour as well as respect and support their partners’ rights and health.

During the 1990s the use of contraception increased in all regions, but Africa lagged far behind. With rising numbers of people in poor countries in their reproductive age, the challenge is to sustain the gains in the decade ahead. Doing so would reduce poverty faster.
In the late 1980s, the Iranian government became more concerned with meeting the social and welfare needs of its rapidly growing population. In 1989 a national family planning programme was integrated into the country’s extensive primary health care system. The programme has increased access and promoted choice of contraceptive use. And in response to the 1994 Cairo International Conference on Population and Development, the programme widened its scope to include other components of reproductive health. Between 1989 and 1997 the contraceptive prevalence rate rose from 49% to 73%.

More than 14 million adolescent girls give birth each year. A large proportion of those pregnancies are unwanted, and an estimated 4.4 million abortions are sought by adolescent girls each year. Many adolescents also face serious risks of contracting sexually transmitted diseases, including HIV/AIDS.

At the end of 1999, 33.6 million men, women and children were living with HIV/AIDS, 95 percent of them in developing countries. More than 16 million have died in the pandemic—more than 13 million in Africa—leaving behind shattered families and crippling the prospects for development. Without effective national programmes and massive international support, the pandemic will continue to spread throughout developing countries, widening the gaps between rich and poor nations.

I do not want to make this world more crowded, and I do not want my life to get poorer.
in the early 1990s about 17 million hectares of tropical forests—four Swisslands—were cleared annually. If this continues, 5–10% of tropical forest species will face extinction in the next 30 years.

**Goal:** Implement national strategies for sustainable development by 2005 so as to reverse the loss of environmental resources by 2015.

**Environment**

Many of the world’s poor depend directly on the environment—agriculture, forestry and fisheries—for their livelihoods. The poor are also most likely to be hurt by air and water pollution and unsustainable practices for food production. Better environmental management can improve their lives, increase their productivity and build momentum towards sustainable development.

Almost 20 percent of the world’s people depend on unimproved water supplies to meet their daily needs. Urban populations are better served than rural, but even piped water from municipal supplies may be contaminated by disease-bearing organisms and industrial pollutants. Those without access to safe water supplies must struggle daily to meet their needs and face the constant danger of water-borne disease.

“We should live here on Earth as though we were intending to stay for good.”
After the 1992 Rio Earth Summit, the Philippines was the first country to establish a council for sustainable development, with partners from government, civil society and private business. The phase-out of leaded gasoline in April 2000 provided a rallying point. The Philippine Agenda 21 is the country’s blueprint for sustainable development. Key businesses have implemented sustainable production initiatives—reusing by-products, controlling pollution and including environmental provisions in collective bargaining agreements with labour unions.

Without human interference, large parts of the world would be covered with forests. Through unsustainable harvesting and degradation, the world has lost millions of acres of forests and with them the economically important wood and non-wood products they supply. Lost forests can no longer conserve soil and water resources, preserve biodiversity, mitigate climate change or protect natural and cultural heritage.
What it will take to achieve the goals

The Republic of Korea, Malaysia and Morocco belong to a select group of countries that halved the proportion of their people living in poverty in less than a generation. So did the Indian states of Haryana, Kerala and Punjab. Another dozen countries—including Botswana and Mauritius—reduced poverty by a quarter or more in a generation. Other countries can learn much from the well-documented lessons of this experience, for if it has been done, it can be done again.

Voices and choices for the poor
Empowering poor people is the starting point—providing opportunities for women, opening political space for poor people to organise. Democratisation has to go beyond simple

Good, honest government fosters—indeed embodies—sound legal and economic institutions. Corrupt judges, weak banking regulations, haphazard public services, limited community participation—each wastes the resources for development. If administrative capacity is adequate, more local participation in the management of social services can greatly increase their effectiveness. And simplifying the rules of business can reduce the opportunities for corruption and promote faster growth and poverty reduction.

A commitment to respect fundamental human rights and the rule of law is a critical prerequisite for sustainable development. Half the world's countries have ratified all six human rights conventions—up from a tenth of countries just 10 years ago. This is significant because, by ratifying treaties, countries open themselves to being held accountable for their actions.
rule by the majority to include minorities in all aspects of political participation—in cabinets, legislatures, civil services and local governments. Such inclusive democracy promotes an independent judiciary, an open civil society and a free media—all of which can ensure respect for human rights and make governments accountable for their promises and actions.

**Pro-poor growth**

Economic growth is not a guarantee of poverty reduction—but it is absolutely essential for sustaining poverty reduction over the longer run. And it needs to be pro-poor. How? It has to generate more income-earning opportunities so that poor people can engage in productive and well-paid work. It has to give poor people more access to assets to help unleash their productive potential and allow them to feed themselves. And it has to be fair in creating better opportunities for poor women. This will require measures to strengthen women’s land rights, increase their bargaining power and broaden their access to credit, training and new technology.

Many countries today need substantially faster pro-poor growth, among them the 30 developing countries whose real per capita incomes are lower today than they were 35 years ago. That growth will be built on increased production among the poor themselves: by productivity increases among small farmers; by small enterprises, both rural and urban; by informal producers.

---

**Countries need to invest more in social services**

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Basic education</td>
</tr>
<tr>
<td>Latin America and the Caribbean</td>
</tr>
<tr>
<td>Sub-Saharan Africa</td>
</tr>
<tr>
<td>Asia</td>
</tr>
</tbody>
</table>

What a country invests in basic health and education signals its commitment to long-term development. At the Copenhagen Social Summit in 1995 the world’s leaders suggested as a rough guideline that 20% of budgetary expenditure and 20% of aid flows should be allocated to basic social services. The objective was for countries to have a healthy, well-educated workforce, able to compete in the global economy. Although the budget allocations to basic social services have recently increased in many countries, such as the Dominican Republic, Guatemala, Malawi and Namibia, few developing countries or donors meet the guideline.

**The growing importance of trade**

Exports and imports of goods ($ billions)

- High-income countries
- Latin America and Caribbean
- Europe and Central Asia
- Middle East and North Africa
- East Asia and Pacific
- Sub-Saharan Africa
- South Asia

Over the past 40 years, trade has grown faster than global output. But heavily protected economies and those dependent on commodity exports have lagged behind or suffered from price fluctuations. More countries now recognise the advantage of open trade, which boosts their exports and increases their capacity to import.
and by the many women and men providing a host of small-scale services.

Economic policies must also be sound, well balanced and sustainable. This requires strengthening national institutions to build the capacity to implement the right economic and social policies.

In all this is a concern for equity, so that all groups in society progress. But the concern for equity also extends to future generations. This means that economic growth must be sustainable—so that what we do to the environment today leaves the natural resources to support life on our planet for future generations.

**Basic social services for all**

Policies have to go beyond the purely economic to focus on the needs of the poor—to ensure minimum social standards and universal access to basic social services. Countries have to invest in education—especially girls’ education, which produces one of the highest payoffs in development. They also have to deliver high-quality and cost-effective services to the poor—health care, water, sanitation and other basic services. Part of this is ensuring action to reduce malnutrition, with a special focus on women of child-bearing age and young children. Countries also have to provide safety nets for the vulnerable—in times of crisis, whether global, national or local.

**Open markets for trade, technology and ideas**

Globalisation offers enormous opportunities to the developing countries—better ways of tapping the world’s knowledge, better technology for delivering products and services, better access to the world’s markets. But taking advantage of the opportunities requires action. Countries have to lower their tariffs and other trade barriers and streamline their systems for the flow of imports, exports and finance. They also have to manage their inflation, interest and exchange rates—to be seen as good places for doing business. And they have to maintain consistent policies—to be credible to investors, both domestic and foreign. The high-income countries have their part to play too—reducing tariffs and other trade barriers to imports from developing countries and providing assistance to build the capacity to trade effectively.

Not all countries are enjoying the possible benefits, however. With a legacy of poor policies and poor performance, too many of them are being left behind in trade, in finance, in technology, in ideas—in precisely the things that could help them grow and reduce poverty.
Effective and equitable use of resources for development

Development costs money. Much comes from the investments by people—and much, from the investments by government. What has spurred the growth of many East Asian countries is their high savings rates, often more than 30% of gross national product. That’s allowed them to invest in infrastructure and social services. Many African countries, by contrast, have had savings rates of only 10–15% of national income, too low to sustain growth fast enough to lift more people from poverty.

It’s important for countries to spend wisely—on basic services for the poor, not on subsidised services for the rich, and on sound investments for future development. How governments spend their money matters as much as what they spend it on. Instability and unpredictability in government expenditures make progress in poverty reduction more difficult. The quality of people that governments recruit also makes a difference. Governments that hire and promote based on merit perform better than those that give the best jobs to friends and political allies.

External aid plays an important part in supporting development, especially in poor countries. There is a growing consensus that country ownership of development policies and country leadership in development programmes are essential for success—and that donor procedures and reporting need to be co-ordinated and harmonised to reduce administrative burdens. Donors and international financial institutions are now working more closely with developing countries on strategies for poverty reduction, formulated through a participatory process and driven by countries. They are also being more selective in the kind of aid that goes to a country, better ensuring that it is tailored to country priorities and local needs.

Donors realise the need to build strategic partnerships that capitalise on each partner’s intrinsic strengths, reflect shared goals and objectives and build on existing achievements. Working in partnership with developing countries, the high-income countries need to supply more aid. They also need to provide more and faster debt relief. They need to offer easier access to their markets, including duty-free and quota-free access for poor countries. And they need to finance programmes of benefit to many countries, such as research on vaccines for tropical diseases. These are the essential ingredients for promoting growth and reducing poverty in the poorest and least developed countries. These are also essential for reducing human suffering and the number of violent conflicts, sustaining the environment and stemming the spread of such global threats as HIV/AIDS.

Aid, on the decline in the 1990s, needs a major boost, especially for the poorest countries

Most OECD countries have adopted a target to provide 0.7% of their GNP as aid, but only Denmark, the Netherlands, Norway and Sweden have met this. Worse, the inclination to help developing countries declined in the 1990s. In just five years, from 1992 to 1997, OECD aid fell from 0.33% to 0.22% of GNP, a decline that halted in 1998 and 1999. Donors need to provide more aid to poor countries, especially to those that use it effectively. Accelerated debt relief to the most heavily indebted poor countries will help to support national strategies for poverty reduction.

More effort needed to attract foreign investment, now concentrated in a handful of countries

Some regions rely almost entirely on aid for their external finance. Private capital flows can add much to what countries put into their development efforts. But these flows are concentrated in fewer than 20 developing countries, and some types of these flows, such as bonds and bank lending, can be volatile. Countries need to create the conditions that attract longer term investments from overseas as well as locally. Mozambique and Uganda are beginning to do just that.

## Sources

### Regional definitions

The regional groupings in this report are based on geographic and cultural affinities and the average income of residents. Developing countries and territories are divided into six regions. In some instances, broader aggregates, roughly corresponding to continental areas, are used. Countries or territories with gross national product per capita of more than $9,360 in 1998 are considered to be high income and are treated as a single group. The term country does not imply political independence or official recognition but refers to any territory for which authorities report separate social or economic statistics.

### Data sources

The statistics in this report were provided by various international agencies, which compiled or estimated them on the basis of reports from national authorities. They are the best available today. But the picture they portray is flawed because for some countries the data are incomplete, unreliable or unavailable.

### Notes and sources

What it will take to achieve the goals of the number of countries with democratic governments are from the World Bank’s World Development Report 1999/2000. Data on the number of countries ratifying human rights treaties were compiled by the United Nations Development Programme (UNDP). Shares of government per capita were estimated from data provided by the International Telecommunication Union. Data on tax revenues are from the International Monetary Fund’s Government Finance Statistics. Data on aid and private capital flows are from the OECD.

### Other sources

Quotations throughout the report were taken from Voices of the Poor, volumes 1 and 2, published by the World Bank, and from reports by development workers around the world.

The accounts of successful programmes to reduce poverty and meet the international development goals are from reports by participants at the Forum on Development Progress held in Paris in March 2000. Additional information comes from reports by the World Bank and United Nations agencies.

The goals for international development address that most compelling of human desires—a world free of poverty and free of the misery that poverty breeds. This report focuses on seven goals, which, if achieved in the next 15 years, will improve the lives of millions of people. In words and pictures, with numbers and charts, it describes progress towards the goals, what has been achieved and the effort required to reach them.
