Monetary conditions have tightened in many emerging market economies, as central banks have responded with policy rate increases to the tighter external financial conditions faced by these economies since the taper talks of May 2013. Nevertheless, real policy rates remain negative or well below precrisis averages in many emerging market economies. Bank credit growth has continued to slow in emerging market economies, although it remains at double-digit rates in some. Economy-wide leverage, as measured by the ratio of bank credit to GDP, has therefore continued to increase.
